== Welcome to the KiCad Developer Documentation

This site contains information for contributors to the KiCad source code, translations, and Python plugins.

=== Building and Contributing to KiCad Software

If you would like to build KiCad from source and contribute bug fixes or new features, please read the link:./getting-started[Getting Started] section carefully. We welcome contributions from new developers and expect all new contributors to familiarize themselves with our policies and guidelines before opening a merge request.

=== Translating KiCad

If you are interested in improving the translation of KiCad into your language, or adding a new language, please read the link:./translation[translation information] page for details.

=== Developing Python plugins

If you are interested in creating plugins using the KiCad Python API (currently only accessible in the PCB editor), the link:./apis-and-binding/pcbnew[Python] section has information about where to find SWIG binding documentation and some examples.

=== Publishing Addons (Plugin and Content Manager packages)

If you are interested in publishing your Python plugin, color theme, or symbol/footprint libraries in the KiCad public content repository, please read the link:./addons[KiCad addons] documentation

for requirements and suggested guidelines.

== Publishing KiCad Addons

This document is a guide for users and plugin developers who are interested in creating addon packages that can be installed by the KiCad plugin and content manager.

=== The Plugin and Content Manager

The plugin and content manager (PCM) allows KiCad users to discover and install addon packages from public or private repositories. These addon packages may contain Python plugins, symbol or footprint libraries, color themes, and other KiCad content.

The KiCad team operates an official repository of addon content that is available by default to KiCad users. Users may also add other repositories, either hosted publicly by third parties or privately (for example, an internal corporate repository).

=== Packaging your content

A KiCad addon package consists of a compressed archive file containing a metadata file, the package content, and several optional files. The archive must be in ZIP format (compatible with the ISO 21320-1 standard). The contents of the archive file depend on the package type, but all packages must include a control file called `metadata.json` that is described in detail below.

NOTE: Addon archives must follow the exact folder structure listed below. Extra files that are not related to your addon are not permitted and must be stripped out of the archive.

==== Python plugins

The structure of a Python plugin archive must look like:

```

Archive root

```
| - plugins
 | - __init__.py
 | - ...
| - resources
 | - icon.png
| - metadata.json
```

```

`icon.png` is an optional 64x64-pixel icon that will be displayed alongside your package in the PCM dialog. If no icon is supplied, the `resources` subdirectory may be empty or omitted.

The contents of the `plugins` subdirectory should include any Python source files and resources required by your plugin. Place your plugin directly inside the `plugins` subdirectory, not inside a second level of subdirectory.

NOTE: For action plugins that supply a toolbar button icon, this icon should be smaller (24x24) and located inside the `plugins` subdirectory. The action plugin toolbar icon will not be used by the PCM.

==== Content libraries

The structure of a content library package must look like:

```

Archive root

```
| - footprints
 | - first-library.pretty
 | - my-footprint.kicad_mod
 | - ...
| - second-library.pretty
```

```

 |- another-footprint.kicad_mod
 |- ...
|- 3dmodels
 |- 3d-library.3dshapes
 |- my-model.stp
 |- my-model.wrl
 |- ...
|- symbols
 |- my-symbols.kicad_sym
 |- ...
|- resources
 |- icon.png
|- metadata.json
...

```

Each content library package must contain one or more of the `footprints`, `3dmodels`, or `symbols` subdirectories. Each of these subdirectories may contain one or more libraries of the corresponding type.

`icon.png` is an optional 64x64-pixel icon that will be displayed alongside your package in the PCM dialog. If no icon is supplied, the `resources` subdirectory may be empty or omitted.

#### ==== Color themes

The structure of a color theme package must look like:

```

...

Archive root
|- colors
 |- my-theme.json
|- resources
 |- icon.png
|- metadata.json
...

```

`icon.png` is an optional 64x64-pixel icon that will be displayed alongside your package in the PCM

dialog. If no icon is supplied, the `resources` subdirectory may be empty or omitted. For color themes, it is best if the icon somehow represents the theme, for example by using the same primary colors and background color as the theme.

==== Metadata file format

The metadata file, `metadata.json`, follows a JSON schema, currently published at <https://go.kicad.org/pcm/schemas/v1>

Unless otherwise noted all fields are limited to valid UTF-8 code points and 1000 characters.

Example `metadata.json` for a color theme:

```
...
{
 "$schema": "https://go.kicad.org/pcm/schemas/v1",
 "name": "My Beautiful Theme",

 "description": "A theme that makes KiCad truly beautiful",
 "description_full": "I came up with this theme in a dream one night.",
 "identifier": "com.github.kicad-user.kicad-beautiful-theme",
 "type": "colortheme",
 "author": {
 "name": "KiCad User",
 "contact": {
 "web": "https://mywebsite.com"
 }
 },
 "maintainer": {
 "name": "KiCad User",
 "contact": {
 "web": "https://mywebsite.com"
 }
 },
 "license": "CC0-1.0",
 "resources": {
```

```

 "homepage": "https://github.com/kicad-user/kicad-beautiful-theme"
 },
 "versions": [
 {
 "version": "1.0",
 "status": "stable",
 "kicad_version": "5.99",
 "download_sha256": "YOUR_SHA256_HERE",
 "download_size": 1234,
 "download_url": "https://github.com/YOUR/DOWNLOAD/URL/kicad-beautiful-theme.zip",
 "install_size": 5678
 }
]
}
...

```

==== Fields

``$schema``: **\*\*(optional)\*\*** Must contain the URL to the current KiCad package JSON schema  
(<https://go.kicad.org/pcm/schemas/v1>)

``name``: **\*\*(required)\*\*** The human-readable name of the package (may contain any valid UTF-8 characters)

``description``: **\*\*(required)\*\*** A short free-form description of the package that will be shown in the PCM  
the package name. May contain a maximum of 150 characters.

``description_full``: **\*\*(required)\*\*** A long free-form description of the package that will be shown in the PCM  
the package is selected by the user. May include line breaks.

``identifier``: **\*\*(required)\*\*** The unique identifier for the package. May contain only alphanumeric characters  
the dash (`-`) symbol. Must be between 2 and 50 characters in length. Must start  
with a latin character and end with a latin character or a numeral. See instructions  
below on namespaces for guidelines for selecting an identifier.

``type``: **\*\*(required)\*\*** The type of the package; one of ``plugin``, ``library``, or ``colortheme``.

``author``: **\*\*(required)\*\*** Object containing one mandatory field, ``name``, containing the name of the package  
creator. An optional ``contact`` field may be present, containing free-form fields with

contact information.

``maintainer``: **\*\*(optional)\*\*** Semantics same as ``author``, but containing information about the maintainer. Can be omitted if same as author.

``license``: **\*\*(required)\*\*** A string containing the license under which the package is distributed.

The license must be a valid string under [link:https://www.debian.org/doc/packaging-manuals/copyright-form](https://www.debian.org/doc/packaging-manuals/copyright-form) with the following modifications:

- The MIT license is always taken to mean the [link:https://www.debian.org/legal/licenses/mit](https://www.debian.org/legal/licenses/mit) [Expat license].
- The Creative Commons licenses are permitted without a version number, indicating the author did not specify which version applies.
- Stripping of trailing zeroes is not recognized.
- ``CERN-OHL`` is recognized as a valid license.
- ``WTFPL`` is recognized as a valid license.
- ``Unlicense`` is recognized as a valid license.

The following license strings are also valid and indicate other licensing not described above:

- ``open-source``: Other Open Source Initiative (OSI) approved license.
- ``unrestricted``: Not an OSI approved license, but not restricted.

``resources``: **\*\*(optional)\*\*** Additional resource links for the package. Place your website, github, documentation and other links here.

``keep_on_update``: **\*\*(optional)\*\*** **\*\*(since KiCad 7.0)\*\*** List of regular expressions describing which files be kept on package update. Each file from the extracted package is tested against all regex with the ``$KICADX_3RD_PARTY`` component removed. If it matches any expression then it will be deleted.

If your plugin type package archive has ``keepme.txt`` file directly in ``plugins`` directory, then path ``/plugins/your_package_id/keepme.txt`` will be tested against all regex in the list.

[NOTE]

====

\* For consistency, directory delimiter will always be forward slash (`/`) even on windows. Tested path with a leading forward slash.

\* Dots in package identifier are replaced with underscore (`\_`) when extracted.

\* When updating the package `keep\_on\_update` field is used as it is in the repository at the moment of update, not at the moment of previous version installation.

\* [link:https://en.wikibooks.org/wiki/Regular\\_Expressions/POSIX-Extended\\_Regular\\_Expressions](https://en.wikibooks.org/wiki/Regular_Expressions/POSIX-Extended_Regular_Expressions)[Extended POSIX regular expressions is used.

====

[TIP]

====

If you want to keep all ini and bkp files on update, this regex will work: `.\*(\.ini|\.bkp)\$`.

If you want to keep all .step files from 3d models directory: `^/3dmodels/.\*\.step\$`

====

`versions`: **\*\*(required)\*\*** A list of objects describing package versions. Each version object can contain the following keys:

`version`: **\*\*(required)\*\*** A string containing the version of the package (format of this is up to you).

`status`: **\*\*(required)\*\*** A string containing one of the following:

- `stable`: This package is stable for general use.
- `testing`: This package is in a testing phase, users should be cautious and report issues.
- `development`: This package is in a development phase and should not be expected to work fully.
- `deprecated`: This package is no longer maintained.

`kicad\_version`: **\*\*(required)\*\*** The minimum required KiCad version for this package (major.minor).

`kicad\_version\_max`: **\*\*(optional)\*\*** The latest KiCad version this package is compatible with (major.minor).

``download_sha256``: **\*\*(optional)\*\*** A string containing a SHA-256 hash of the package archive.

``download_url``: **\*\*(optional)\*\*** A string containing a direct download URL for the package archive.

``download_size``: **\*\*(optional)\*\*** The size of the package archive, in bytes.

``install_size``: **\*\*(optional)\*\*** The size of the package (uncompressed), in bytes.

``keep_on_update``: **\*\*(optional)\*\*** **\*\*(since KiCad 7.0)\*\*** Same semantics as corresponding field in package schema specific to this version. Field of the package version user is updating **\*\*to\*\*** is used, package user is updating **\*\*from\*\***.

``runtime``: **\*\*(optional)\*\*** **\*\*(since KiCad 9.0.1)\*\*** For plugin packages, this field may be set to either "ipc" or "swig" to indicate which runtime the plugin requires. If not set, the plugin will be assumed to require the SWIG (legacy) runtime.

NOTE: The ``download_*`` keys must only be present in the version of the ``metadata.json`` that you submit to the package metadata repository, not in the version of the file that is actually present in the package archive. It is not possible to put a valid ``download_sha256`` value in the ``metadata.json`` file inside the archive.

### === Submission to the official repository

KiCad hosts an official addons repository that is available by default to all KiCad users. To be included in the official repository, your package must meet several requirements beyond the technical requirements described above.

### ==== Namespacing and naming

- Your package identifier **\*\*must\*\*** be namespaced using reverse-DNS format. For example, official KiCad addons use the namespace ``org.kicad.packagename``.
- If your addon content is hosted on a publicly-visible code-hosting service such as GitHub or GitLab, your namespace should be based on this service. For example, ``com.github.username.packagename``. The package identifier should generally match the repository

name if there is a 1-to-1 correspondence between the package and the repository.

- Your package namespace may also be based on a domain name that you control. If there is no obvious link between the domain name you submit and the download location of your package, or if it is not otherwise clear that you control the domain name, the KiCad team may request further information before approving your submission.
- Your package identifier **\*\*must\*\*** be unique. The namespacing requirements above should make this easy.
- If you are not clearly a maintainer of the project, we must have written confirmation from a maintainer that you are permitted to submit the project to the KiCad repository on their behalf.
- Your package must not be a fork or copy of an existing package in the KiCad repository, unless your fork is significantly different in scope from the original work and has a clearly unique name, or unless you are proposing to replace an abandoned project (see below).

#### ==== Licensing

- Packages **\*\*must\*\*** be licensed under a valid open-source license. Closed-source packages may be used with KiCad under a third-party repository, but all packages in the official KiCad repository must be open-source to allow for code review, issue reporting, and to maintain license compatibility with KiCad itself.
- Packages containing code (Python plugins) **\*\*must\*\*** be licensed under an open-source license [link:https://www.gnu.org/licenses/license-list.en.html#GPLCompatibleLicenses](https://www.gnu.org/licenses/license-list.en.html#GPLCompatibleLicenses)[compatible with the GNU GPL].
- Packages containing data (color themes, libraries, etc) should be licensed under a Creative Commons or similar license.

#### ==== Technical requirements

- Metadata files submitted to the official repository **\*\*must\*\*** include the ``download_sha256`` key in the metadata, containing a valid SHA-256 hash of the archive file.

- The ``download_url`` **must** point to a publicly-accessible URL.
- Package metadata **must** be in English. Package contents (for example, the language used inside a dialog created by a Python plugin) may be in any language, but the package description should clearly state if the contents are in a language other than English. At this time, KiCad does not have a built-in mechanism to allow for plugins to offer multiple language translations.
- The package source **must** be hosted in a location that allows issue reporting and tracking. Examples that meet this requirement include GitHub, GitLab, Bitbucket and Sourceforge.

#### ==== Content policy

- Packages added to the official KiCad addon repository **must** follow our community link:[https://www.kicad.org/contribute/code-of-conduct/\[Code of Conduct\]](https://www.kicad.org/contribute/code-of-conduct/[Code of Conduct]).  
The KiCad team reserves the right to review package content and metadata and reject submissions that violate this code of conduct.
- The KiCad team makes no guarantees about the quality, security, or safety of any addon content, but will strive to maintain a general standard of security and safety. If a security, safety, or privacy issue related to a package is brought to our attention, we reserve the right to take corrective actions up to and including removing a package from the repository without advance notice. In this case, the package can be submitted to the repository again once the issue has been resolved to the satisfaction of the KiCad team.
- The KiCad team reserves the right to modify or expand on this policy in the future in order to best meet the needs of the KiCad user community. Publishers of existing packages that become in violation of new or updated content policies will receive advance notice and have the opportunity to make changes to meet the updated policies.

#### ==== Abandoned content policy

- The KiCad team may consider a package published to the official repository abandoned if we are unable to contact the maintainer, or if it has bugs preventing its use on a stable version of KiCad that remain open with no feedback for longer than 90 days. In order to prevent the situation of users installing broken packages from the official repository, the KiCad team may

edit (for example, by changing the `kicad\_version\_max` field) or remove packages from the repository if they have been abandoned.

- Anyone wishing to "revive" an abandoned project can do so either by taking over maintenance of it from the original submitter (with their permission) or by forking it and submitting it under a new name. The standard requirements for all packages will apply to the newly-forked project.

#### ==== Commercial Services

- Packages that link to or provide commercial services, including but not limited to PCB fabrication, component lookup and order management, **\*\*must\*\*** first contact the KiCad team at [plugins@kicad.org](mailto:plugins@kicad.org)

#### ===== Commercial Service FAQ

.Why do we need to e-mail the KiCad Team?

[%collapsible]

====

We need to have a simple contract on file with the commercial service provider. This protects both the KiCad project and the commercial service provider.

====

.I wrote a plugin that only uses public APIs of a service provider. Do I need to e-mail the KiCad Team?

[%collapsible]

====

In general, we will only deal with the service provider. They may be interested in contracting with you to build a plugin or in allowing third-party plugins generally. Either way, we need to discuss this directly with the service provider.

====

.What if the API terms of service already allow my plugin?

[%collapsible]

====

We are not lawyers. We pay lawyers to review our contracts and make sure that the KiCad project and, by extension, our users are legally safe. We do not have the resources to review other entities' terms of service or to watch them for changes. This is one reason why we need

a direct contract with the commercial service provider.

====

.Doesn't this process go against the spirit of Open Source?

[%collapsible]

====

No. We place no restrictions on users publishing and publicising their own plugins. Open Source does not require us to distribute or publish others' content.

====

.My plugin formats KiCad data for easier use by a commercial service provider. Do I need to e-mail the KiCad team?

[%collapsible]

====

No. As long as your plugin doesn't connect to the commercial service provider, we do not need a contract with the provider.

====

.I represent a commercial service provider. Can we provide a blanket allowance for developers to use our /

[%collapsible]

====

Yes! We love it when we can make the process of PCB creation easier for our users. Please e-mail the KiCad team at [plugins@kicad.org](mailto:plugins@kicad.org) and we'll help to make this happen.

====

### === Submitting your package

Once you have created a package following the guidelines above, and confirmed that your package is available for download using the URL listed in the metadata file, you can submit your package to the official KiCad addon repository.

To do so, you must have an account at GitLab, and submit your metadata file as a merge request to the Package Metadata repository at <https://gitlab.com/kicad/addons/metadata>. Create a directory inside the packages directory named the same as your package identifier, and containing the `metadata.json` file and any additional optional metadata files (for example, an icon) as described

above. You may submit more than one new package in a single merge request as long as the packages share a namespace.

NOTE: Do not submit merge requests to the public-facing repository at

<https://gitlab.com/kicad/addons/repository> - changes to this repository are made automatically based on changes to the metadata repository.

### === Updating your package

Updates should be submitted as additional merge requests that change the `metadata.json` file (and any other package files that need updating). You may submit updates to more than one package in a single merge request as long as the packages share a namespace.

== KiCad IPC API

The IPC API is an interface that can be used to remotely control a running instance of KiCad. This can be used to implement KiCad plug-ins as well as to interface KiCad with external software. The API is currently under development, with the plan of stabilizing the first version for KiCad 9.0.

=== Overall Design Principles

The KiCad API is implemented using Protocol Buffers to define the structure and contents of messages, and NNG to transport messages between processes using UNIX sockets. This implementation supports all supported KiCad platforms, including Windows, macOS, and many Linux/BSD variants. Each running KiCad instance acts as a server when the API is enabled, and plugins and other applications act as clients which open connections to KiCad.

KiCad is an event-driven GUI application, and like most other such applications, it operates a single thread that handles all events (background worker threads are used for certain computations to improve performance). While the API server itself is decoupled from the rest of KiCad, API events are handled like any other form of user input, and thus are synchronous. This is an important difference from other APIs that users may be used to (for example, APIs for web services) which are often asynchronous to some extent. In practice, this means a few things must be kept in mind:

1. The KiCad user may be doing something with the application that blocks the API, in order to prevent out-of-order event issues and to prevent third-party software from disrupting the user.

This means that API clients need to anticipate that API messages may sometimes timeout or fail because KiCad is busy, and should have a facility to retry requests.

2. An application should not open multiple connections to KiCad at the same time. While the underlying transport layer supports this, KiCad itself will force an ordering of handling API requests and so there is no advantage to doing so.

The API surface described by Protocol Buffers messages ("protobufs") is stable following the link:[https://protobuf.dev/programming-guides/dos-donts/\[best practices\]](https://protobuf.dev/programming-guides/dos-donts/[best practices]) described by the Protocol Buffers team. In general, this means that new versions of KiCad may introduce new messages and fields, but will not modify the meaning of existing messages and fields. Items in the API may be deprecated over time; deprecated messages and fields will be supported for at least one major version of KiCad after the deprecation is announced.

Plugins developed for the IPC API are launched in standalone processes that then communicate with the KiCad process that launched them. Environment variables are used to inform the plugin about the IPC socket path and a unique identifier for the running KiCad instance. This allows multiple instances of KiCad to run side-by-side and launch plugins that can communicate with the correct instance. Third-party software that is not launched as a KiCad plugin can also communicate with any running KiCad instance, however it is up to the third-party software to decide how (and if) to handle the case of multiple running KiCad instances.

=== Detailed information

The link:./for-kicad-developers/[For KiCad Developers] section contains information on the technical implementation of the API on the C++ side, and guidelines for modifying and extending the API. Please read this section before working on contributions that touch the API.

The link:./for-addon-developers/[For Add-on Developers] section contain information for users of the API. Please read this section if you are interested in developing KiCad plugins or interfaces with third-party software.

== API Documentation for Add-on Developers

The KiCad IPC API is a new feature in KiCad 9.0 that allows third-party applications to interact with KiCad. Unlike the SWIG-based Python bindings to KiCad's PCB editor, the IPC API is designed to be a stable interface that does not change when KiCad's internals are refactored, and does not require that KiCad build against Python directly. It is also designed to be language-agnostic, so that interoperability with software written in languages other than Python is possible.

=== API Status and Goals

The initial release of the IPC API in KiCad 9.0 is focused on a particular set of use cases that will allow many (but not all) of the things that people have built using the SWIG-based Python bindings to be done with the new API. The API will be expanded over time (and, when practical, additions will be backported to the 9.0 branch).

There are a few important limitations to be aware of when considering use of the IPC API:

1. The IPC API currently only supports communication with a running instance of the KiCad GUI.

There is no support for running KiCad in a headless mode, and unlike the SWIG-based Python bindings, the IPC API does not provide an independent way to load and process KiCad PCB files outside of the KiCad editor. In the future, a headless mode (implemented through `kicad-cli`) will support third-party tools that want a way to interact with KiCad design files without

running the full KiCad GUI. Even then, third-party tools will need to launch ``kicad-cli`` and then communicate with it. There are no plans to support a standalone library for loading and manipulating KiCad files separate from the client-server (IPC) model.

2. The IPC API currently has no support for plotting or exporting files from KiCad designs. This support may be added in the future, however the primary way we expect users to export files and generate other outputs from KiCad design files in an automated way is through the use of the ``kicad-cli`` tool. If you are currently relying on Python scripting for generating outputs from KiCad, we recommend moving to ``kicad-cli``.

In KiCad 9.0, the IPC API and the new IPC plugin system are only implemented in the PCB editor, due to development time constraints. In the future, the IPC API will be expanded to support the schematic editor, library editors, and other parts of KiCad. While there are specific places where the IPC API has new features that are not available in the SWIG-based Python bindings, in general, the capabilities of the IPC API in KiCad 9.0 should be seen as equivalent to the Action Plugins system present since KiCad 5: a way to interact with a running KiCad PCB Editor session.

The API is still under active development, although after KiCad 9.0.0 is released, existing API messages will be treated as stable and will be supported according to our deprecation policy. We encourage developers to report issues and request new capabilities as they experiment with the API.

### === Connecting to KiCad

API clients such as scripts and plugins connect to KiCad using a Unix domain socket on macOS and Linux, and a named pipe on Windows. The socket or pipe is created by KiCad in the user's temporary directory when KiCad is launched. The name of the socket or pipe is ``api.sock`` by default, but multiple instances of KiCad can be run simultaneously, and if this name is already taken, KiCad will append its process id number (PID) to the name to make it unique.

When KiCad launches API plugins (see below), it will set several environment variables that can be used by the client to know where to connect to the IPC API. These variables include:

- ``KICAD_API_SOCKET``: The full path to the socket or pipe that the client should connect to.
- ``KICAD_API_TOKEN``: A generated token that the client should use in request messages. This token is generally passed to the API client library when creating a connection to KiCad (for example,

in the `__init__` method of a `KiCad` object in `kicad-python`). This token is unique to the running instance of KiCad, and can be used by long-running clients to detect if KiCad restarts in the middle of a session.

API clients do not need to be launched from KiCad, but if they are not (for example, if a client is launched from an IDE while developing a plugin), the client will not have access to these environment variables. For this reason, it is recommended that plugin developers run only one instance of KiCad at a time while developing and testing plugins.

### === Plugin Action registration

IPC plugins can register actions that appear on the PCB editor's toolbar much like the SWIG-based Action Plugins system. There are several differences in how this is done, however:

1. The default directory for IPC plugins is ``${KICAD_DOCUMENTS_HOME}/<version>/plugins``, where ``${KICAD_DOCUMENTS_HOME}`` is the root path for KiCad's user data directory, which is platform-dependent. On Windows, it is typically `C:\Users\<username>\Documents\KiCad`, on macOS it is typically `~/Users/<username>/Documents/KiCad`, and on Linux it is typically `~/.local/share/KiCad`.
2. Plugins must provide a `plugin.json` file containing metadata about the plugin and any actions it provides. The `plugin.json` file must be in a subdirectory of the plugins directory, and must follow the link:<https://go.kicad.org/api/schemas/v1>[schema defined by KiCad].

The plugin system currently supports two types of plugins: Python-based, and executable. Python plugins are run by an external Python interpreter (unlike the SWIG-based plugins which run in an interpreter embedded into KiCad), and KiCad will automatically manage the creation of a virtual environment for each plugin using the chosen Python interpreter. On macOS and Windows, KiCad will continue to ship with its own Python interpreter, which will be used by the IPC system by default if the user does not specify a different interpreter. On Linux, KiCad uses the first version of Python found in the user's PATH by default. Executable plugins are run as separate processes with an arbitrary command line, and can be used to launch plugins written in compiled languages, or any other kind of external tool that does not require a Python environment.

### === Debugging

There are a few ways to get debug information from KiCad that might be useful while developing

against the IPC API, including trace output from KiCad as well as a log of all API requests and responses.

To enable API-related trace output from KiCad itself (which is particularly useful for debugging Python plugins that are being loaded by KiCad), set the following environment variables before launching KiCad:

```
[source,sh]
```

```

```

```
KICAD_ALLOC_CONSOLE=1 # If you are on Windows, this variable is required to show any output
KICAD_ENABLE_WXTRACE=1 # This enables KiCad's tracing system even when running a release build
WXTRACE=KICAD_API # This enables trace output for the API subsystem
```

```

```

To enable the API log file, create an advanced config file in your KiCad

link:[https://docs.kicad.org/8.0/en/kicad/kicad.html#settings\[configuration directory\]](https://docs.kicad.org/8.0/en/kicad/kicad.html#settings[configuration directory])

if you don't have one already (a plain text file named `kicad\_advanced`), and add the following

line:

```
[source]
```

```

```

```
EnableAPILogging=1
```

```

```

This will create a file at `\${KICAD\_DOCUMENTS\_HOME}/<version>/logs/api.log` containing every API request and response at the Protobuf message level.

NOTE: The API log file can grow quite large, so be sure to disable it when you are done debugging.

Plugins using the Python runtime are launched from a virtual environment created by KiCad for that plugin. You can find the virtual environment for each plugin located in a cache folder

`\${KICAD\_CACHE\_HOME}/python-environments/<plugin\_identifier>`. The default `KICAD\_CACHE\_HOME` is platform-dependent: `~/Library/Caches/KiCad/<version>` on macOS,

`C:\Users\<username>\AppData\Local\KiCad\<version>` on Windows, and `~/.cache/KiCad/<version>` on

most Linux systems. Activating this virtual environment will allow you to run the plugin from a terminal or IDE, manually install Python packages, and debug the plugin using the Python debugger.

### === Python Bindings

``link:https://gitlab.com/kicad/code/kicad-python[kicad-python]`` is the official Python bindings library for the IPC API. It is a wrapper around the Protobuf-based API that exposes Python classes and helper methods that make it easier to interact with the IPC API from Python.

The ``kicad-python`` library is available on `link:https://pypi.org/project/kicad-python/[PyPI]`.

Automatically-generated documentation for ``kicad-python`` is available online at `https://docs.kicad.org/kicad-python-main/`.

There are some examples of scripts and plugins in the ``examples`` directory of the ``kicad-python`` repository that may be a good starting point for developing your own tools.

== API Documentation for KiCad developers

The IPC API is implemented inside KiCad by a server thread that listens on a UNIX socket for connections using the nanomsg next generation (nng) protocol. At the moment, this socket operates in request-reply mode, with KiCad as the server, so asynchronous notifications to API clients is not possible. This server passes messages to the rest of KiCad using a wxWidgets event to cross onto the main (UI) thread. As with all other interactive KiCad events, the rest of API processing happens on the UI thread.

Messages are contained within an envelope structure, which is unpacked and then dispatched to a request handler according to the type of the interior Protobuf message. Request handlers are functions that typically belong to a subclass of the ``API_HANDLER`` class. The low-level infrastructure of the API all lives in ``kicommon`` and is shared between all parts of KiCad, but request handlers are dynamically registered and so can be attached to specific frames. If a certain message does not have a handler registered to it, the API server will return an error to the client.

Handlers are processed one by one, and it is possible to register more than one handler for a given message type. This is useful for situations where a message has some specifying target information that can narrow down its effect to a subset of available handlers. For example, the ``GetOpenDocuments`` message takes a ``DocumentType`` parameter that specifies which type of documents to query. Each open editor frame can register a handler for the same message, and return

...

### === Transport and wire protocol

The underlying transport mechanism for the API is [link:https://github.com/nanomsg/nng](https://github.com/nanomsg/nng) [nng], which is a library providing messaging primitives, including inter-process communication (IPC). The IPC mechanism used by KiCad's API is to serialize protocol buffers to bytes and send them over a UNIX socket. KiCad does not currently make use of any of the more advanced features of nng.

The socket is opened at ``/tmp/kicad/api.sock`` on macOS and Linux, and in a subdirectory of the user's temporary file directory on Windows. If multiple instances of KiCad are launched, the socket filename for every KiCad instance other than the first will be ``api-<PID>.sock``, where ``<PID>`` is the process identifier of the KiCad instance.

### === Protocol Buffers

The API itself is implemented as [link:https://protobuf.dev/\[Protocol Buffers\]](https://protobuf.dev/[Protocol Buffers]) (protobufs), a way of describing and serializing messages that, if used correctly, can provide stability for API clients while allowing KiCad internals to evolve. It is important for every KiCad developer who works on the API to read and understand the protobuf

[link:https://protobuf.dev/programming-guides/dos-donts/\[programming best practices\]](https://protobuf.dev/programming-guides/dos-donts/[programming best practices]) and [link:https://protobuf.dev/programming-guides/api/\[API best practices\]](https://protobuf.dev/programming-guides/api/[API best practices]), as the KiCad API attempts to follow these guidelines in most circumstances. Some of the most important practices are:

1. Care must be taken whenever evolving the API in a way that seeks to deprecate, rename, or otherwise change the existing messages and fields. In general, the API should be designed as much as possible to support both the current state of KiCad and anything we know about our desired future state, to avoid needing to deprecate lots of messages in the future.
2. Plain data types should be used sparingly. It is almost always a better idea in terms of future-proofing and API evolution to wrap data types in a container message, even if these types are represented by a single plain old data variable in KiCad's C++ internals. This is particularly true for boolean values: they should almost never be included in protobuf messages. Instead, an enum type should be defined that distinguishes between UNKNOWN (which should always have the value of ``0``) and ``false``. This also makes it possible to swap out the boolean for a tri-state

at a later point in time with no compatibility issues.

3. Be careful about message nesting. It is not always a good idea to attempt to duplicate the object hierarchy of KiCad's internal C++ classes into a hierarchy of messages. Sometimes, KiCad's object hierarchy comes more from developer convenience or history than logical design, and this hierarchy doesn't always make sense at an abstract conceptual level. The API should, in general, be *conceptually* logical and not have its design influenced by how KiCad's C++ is designed.

### === Enumerations

Exposing enumerations to the API requires special care to minimize the chance of bugs and compatibility issues. To expose a new C++ enum type to the API, do the following:

1. Define a new protobuf enum for the type. This enum should have a CamelCase name that clearly describes the type -- use this as a chance to double-check if the KiCad type is named clearly.
2. Fill out the values for the protobuf enum. Each value should be an UPPER\_SNAKE\_CASE name, and begin with a prefix to avoid namespace conflicts (protobuf enums are implemented as plain enums, not C++ enum classes). That prefix is conventionally the abbreviation of the CamelCase enum name, for example `StrokeLineStyle` has values like `SLS_SOLID`, but this can be deviated from where it makes sense. The first enum value must always be `<prefix>_UNKNOWN` and must be assigned the value `0`. This value represents a message where this enum has not been set, and does not map to an equivalent C++ enum value. Because of this, and because protobuf enums may not contain negative numbers, it is generally not going to be the case that there is a 1:1 mapping between C++ enum value and protobuf enum value.
3. Define a specialization of `FromProtoEnum` and `ToProtoEnum` for your new enum. There are several source files where these specializations could go, based on what compilation unit your enum's C++ definition lives in. For example, shared (common) enums go in `common/api/api_enums.cpp`.
4. Add your enum to the QA tests in `qa/tests/api/test_api_enums.cpp`. Check that the tests pass, which will confirm that your To/From function implementations are correct.  
Note that as enum definitions evolve over time in KiCad, the protobuf versions must never have values deleted or modified: they can only have values deprecated and new values added! Use the

``ToProtoEnum`/`FromProtoEnum`` functions to handle any changes in how the values should map to KiCad internals.

### === Adding, Modifying, and Removing API surface

Please follow these guidelines when making any changes or additions to the API or to code that depends on the API surface (for example, when adding, removing, or modifying the behavior of an object's properties):

1. Never rename, re-order, or change the functional meaning of existing fields in any Protobuf messages. The only changes permitted are to add new fields or to remove deprecated fields by commenting them out (preserving their original field index, which must never be re-used).
2. Never remove fields in a bugfix release of KiCad. If a field is deprecated, add a comment above it noting the deprecation (and any replacement, if applicable). The field must remain in the message until the next major KiCad release (at minimum). If it is necessary to deprecate a field in a bugfix release, the serialization code must continue supporting the deprecated field as best as possible (for example, serializing a default value even if the field no longer exists on the source object, and accepting but ignoring the value when deserializing).
3. Never remove or change the meaning of any Protobuf enum values. If enums on the KiCad side change such that a Protobuf enum value no longer makes sense, mark it as deprecated with an appropriate comment, and update the ``ToProtoEnum`` and ``FromProtoEnum`` functions to handle the deprecated value in whatever way makes sense.
4. Please document fields that are added to existing messages with a note such as ``// Since: 9.0.1`` in the comment line above the field. These comments will be included in client bindings, so adding information about when new APIs were introduced will help make sure the binding documentation is kept up-to-date.

### === Object Serialization

Objects on the drawing canvas (in other words, the KiCad classes that represent "real things" that the user places, modifies, etc) are all subclasses of the ``SERIALIZABLE`` interface. This means that in order to expose them to the API, all you need to do is:

1. Define a protobuf message describing that object
2. Add the object to the QA tests in ``qa/test/api/test_api_proto.cpp`` -- you may need to extend the ``api_kitchen_sink.kicad_pcb`` test file with instances of your object. Make sure there is at least one instance of your object that has all its properties set to non-default values for best test coverage.
3. Implement the ``::Serialize`` and ``::Deserialize`` methods, and iterate on them until the QA tests pass.

When adding new object messages, look at what exists already and try to be consistent. Design for the desired conceptual representation of an object, even if that doesn't completely match the current C++ implementation. And only include "concrete" data about the objects in the message. Calculated/computed properties of an object should rarely be included in an object's main message.

Be careful about datatypes as well: as described above, plain data types (ints, bools, strings) are usually not the right choice to describe a property, as they can limit the ability to evolve that property over time. Prefer enums and container messages.

Use protobuf message hierarchies sparingly -- it is generally not a good idea to encode KiCad's C++ class hierarchies into messages as described above. For example, in KiCad, a ``PCB_TRACK`` and a ``PCB_VIA`` are related by inheritance, but there are separate ``Track`` and ``Arc`` protobuf messages that duplicate their shared properties, rather than defining the ``Arc`` message as containing an inner ``Track`` message. The cost of a slight increase in code duplication is worth it because it prevents confusing/convoluted API surfaces (protobuf does not support inheritance, so the arc properties would need to be accessed as ``arc.track.start`` and ``arc.mid`` for example) and reduces interdependence between messages that could make API evolution more painful in the future.

### === Common data types

The ``base_types.proto`` file contains a number of data type definitions that are used throughout the API. Use these (and expand them) instead of defining more specific types, where it makes sense. Some of the types to be aware of: ``KIID``, ``Vector2``, ``Distance``, ``Angle``, ``Ratio``, ``Color``, etc.

Note that all physical distances that represent concrete object properties in the API are represented as 64-bit integer nanometer values, regardless of what part of KiCad they come from.

### === API Handlers

A handler function is any function-like construct with the following signature:

```
```cpp
HANDLER_RESULT<ResponseType>( HandlerType::* aHandler )( RequestType&, const HANDLER_CONTEXT& )
...

```

In this signature, `RequestType` and `ResponseType` are protobuf message classes, and `HANDLER_RESULT<T>` is a typedef for `tl::expected<T, ApiResponseStatus>`. `tl::expected` is a library that backports `std::expected` to older C++ and adds some functionality beyond the STL spec. This type represents either an expected value, or an unexpected value that contains more information about why something failed. The expected value is always just the response message that we want to send back to the client, and the unexpected value, `ApiResponseStatus`, is a message that contains a status code as well as an error message string.

For example:

```
```cpp
e.set_status(ApiStatusCode::AS_BAD_REQUEST);
e.set_error_message(fmt::format("the client {} already has a commit in progress",
 aCtx.ClientName));

return tl::unexpected(e);
...

```

Notice that the error message begins lowercase and has no punctuation. This is because the error returned by this handler will almost always be composed with other fragments to form a full sentence (for example, the text `"KiCad API error: "` might be prepended).

The status code `ApiStatusCode::AS_UNHANDLED` is used as a special flag to note that this handler can't handle the given request, but there was nothing in particular wrong with the request. This is used in situations when the same request is routed to multiple handlers, one after the other, in case one of them is able to handle the request.

The base class `API_HANDLER_EDITOR` is used to provide many of the common handlers that all the

graphical editors in KiCad need, such as object CRUD, document retrieval, etc. This is then specialized into ``API_HANDLER_PCB``, ``API_HANDLER_SCH``, and so on. Handlers that don't require an editor frame to be open are in ``API_HANDLER_COMMON``.

Handlers always get passed a ``HANDLER_CONTEXT`` structure that contains information about the API request that is in flight. This can be used to tell apart multiple different API clients, for example.

title: PCB Python Bindings

weight: 18

---

:toc:

== Deprecation notice

WARNING: The SWIG-based Python bindings in KiCad are deprecated as of KiCad 9.0 and will be removed in a future version. They will be replaced by the link:../ipc-api/[IPC API], which is a stable interface that is accessible from many languages including Python. The current plan is to remove the SWIG bindings in KiCad 10.0. This plan is subject to delay based on development timelines and community feedback. KiCad 10.0 is currently planned for release in February 2026.

Check out the link:<https://gitlab.com/kicad/code/kicad-python>[kicad-python library] for a Pythonic interface to the IPC API.

== Introduction

KiCad implements a Python plugin interface so that external Python plugins can be run from within the PCB editor. The interface is generated using the `Simplified Wrapper and Interface Generator` or <http://www.swig.org>[SWIG]. SWIG is instructed to translate specific C/{cpp} header files into other languages using `interface` files. These files ultimately decide what C/{cpp} functions, classes and other declarations are exported and can be found in `*pcbnew/swig/*`.

During build-time the SWIG interface files are used to generate the corresponding .py files. These files are installed into Python's system-wide `*dist-packages*` repository, thus they can be imported by any Python 3

interpreter installed on the system.

WARNING: Since this interface is a raw binding layer over KiCad rather than a true API, it is unstable and will generally change between KiCad major versions. While the development team will make reasonable efforts to maintain compatibility of function, there are no guarantees on strict compatibility, so plugins will need to handle situations such as function calls and data types being renamed from time to time.

Python bindings are provided for the PCB editor only at this time. Using Python from within the other parts of KiCad is not supported. The Python binding module is called ``pcbnew``, a reference to the internal name of the PCB Editor (which was its official name in old versions of KiCad).

#### == Existing PCB Editor Python Bindings documentation

The PCB Editor Python bindings can be used stand-alone, i.e. no instance of the PCB Editor is running and the board project to be manipulated is loaded and saved from and to file. This approach is shown with some examples in the <https://docs.kicad.org/master/en/pcbnew/pcbnew.html> [documentation].

Another documentation source is the auto-generated Doxygen reference of the bindings. It can be found here:

- \* <http://docs.kicad.org/doxygen-python-6.0/namespacepcbnew.html> [KiCad 6.0]
- \* <http://docs.kicad.org/doxygen-python-7.0/namespacepcbnew.html> [KiCad 7.0]
- \* <http://docs.kicad.org/doxygen-python-8.0/namespacepcbnew.html> [KiCad 8.0]
- \* <http://docs.kicad.org/doxygen-python-nightly/namespacepcbnew.html> [KiCad Nightly]

#### == "Action Plugin" Support

Besides the stand-alone usage of the generated Python plugin interface, additional support regarding online manipulation of board projects is available for the PCB Editor. Plugins using this feature are called *\*Action Plugins\** and they are accessible using a PCB Editor menu entry that can be found under *\*Tools->External Plugins\**. KiCad plugins that follow the *\*Action Plugin\** conventions can be made to show up as external plugins in that menu and optionally as top toolbar button. The user can run the plugin resulting in calling a defined entry function in the Python plugin's code.

This function can then be used to access and manipulate the currently loaded board from the Python script environment.

### === Typical Plugin Structure

The \*Action Plugin\* support is implemented in the PCB editor by discovering Python packages and Python script files in specific directories on startup.

In order for the discovery process to work, the following requirements must be met.

- \* The plugin must be installed in the KiCad plugins search paths as documented in ``scripting/kicadplugins.i``. You can always discover the search path for your setup by opening the scripting console and entering the command:

```
`import pcbnew; print(pcbnew.PLUGIN_DIRECTORIES_SEARCH)`
```

Currently on a Linux Installation the plugins search path is

```
* `/usr/share/kicad/scripting/plugins/``
* `~/.kicad/scripting/plugins`
* `~/.kicad_plugins/``
```

On Windows

```
* `%KICAD_INSTALL_PATH%/share/kicad/scripting/plugins`
* `%APPDATA%/Roaming/kicad/scripting/plugins`
```

On macOS, there is a security feature that makes it easier to add scripting plugins to the `~/Library...` path than to `kicad.app`, but the search path is

```
* `/Applications/kicad/Kicad/Contents/SharedSupport/scripting/plugins`
* `~/Library/Application Support/kicad/scripting/plugins`
```

- \* Alternatively a symbolic link can be created in the KiCad plugin path link to the plugin file/folder in another location of the file system. This can be useful for development.

- \* The plugin must be written as a simple Python script (\*.py) located in the

plugin search path. Note that this method is preferred for small plugins consisting of a single .py file.

- \* Alternatively the plugin must be implemented as a Python package conforming to the Python package standard definitions (See <https://docs.python.org/2/tutorial/modules.html#packages> [6.4. Packages]. Note that this method is preferred for larger plugin projects consisting of multiple .py files and resource files such as dialogs or images.
- \* The Python plugin must contain a class derived from `pcbnew.ActionPlugin` and it's `register()` method must be called within the plugin.

The following examples demonstrate the plugin requirements.

#### === Simple Plugin Example

The folder structure of the simple plugin is fairly straight forward.

A single Python script file is placed into a directory that is present in the KiCad plugin path.

```

+ ~/.kicad_plugins/ # A folder in the KiCad plugin path
- simple_plugin.py
 - simple_plugin.png (optional)

```

The file `simple\_plugin.py` contains the following.

[source,python]

```

import pcbnew

import os

class SimplePlugin(pcbnew.ActionPlugin):

 def defaults(self):

 self.name = "Plugin Name as shown in Pcbnew: Tools->External Plugins"

 self.category = "A descriptive category name"

 self.description = "A description of the plugin and what it does"
```

```

 self.show_toolbar_button = False # Optional, defaults to False

 self.icon_file_name = os.path.join(os.path.dirname(__file__), 'simple_plugin.png') # Optional, de

def Run(self):

 # The entry function of the plugin that is executed on user action

 print("Hello World")

SimplePlugin().register() # Instantiate and register to Pcbnew

```

Note that if specified `icon\_file\_name` must contain absolute path to the plugin icon.  
It must be png file, recommended size is 24x24 pixels. Alpha channel for opacity is supported.  
If icon is not specified a generic tool icon will be used.

An additional property `self.dark\_icon\_file\_name` may be specified to provide an alternate icon for dark window themes. If this property is not present, the icon specified in `icon\_file\_name` will be used when the dark theme is active;

`show\_toolbar\_button` only defines a default state for plugin toolbar button. Users can override it in the PCB Editor preferences.

### === Complex Plugin Example

The complex plugin example represents a single Python package that is imported on startup of the editor. When the Python package is imported, the `\_\_init\_\_.py` file is executed and is thus a perfect place to instantiate and register the plugin to KiCad.

The big advantage here is, that you can modularize your plugin much better and include other files without cluttering the KiCad plugin directory.

Additionally, the same plugin can be executed standalone using `python -m` e.g. to perform tests on the Python code.

The following folder structure shows how complex plugins are implemented:

```

+ ~/.kicad_plugins/ # this directory has to be in the plugin path
+ complex_plugin/ # The plugin directory (A Python package)
```

- `__init__.py` # This file is executed when the package is imported (on PCB editor startup)
- `__main__.py` # This file is optional. See below
- `complex_plugin_action.py` # The ActionPlugin derived class lives here
- `complex_plugin_utils.py` # Other Python parts of the plugin
- `icon.png`
- + `otherstuff/`
  - `otherfile.png`
  - `misc.txt`

----

It is recommended to name the file containing the ActionPlugin derived class as  
`<package-name>_action.py`.`

In this case the file is named `complex_plugin_action.py`` with the following  
 contents:

[source,python]

----

```
import pcbnew
```

```
import os
```

```
class ComplexPluginAction(pcbnew.ActionPlugin):
```

```
 def defaults(self):
```

```
 self.name = "A complex action plugin"
```

```
 self.category = "A descriptive category name"
```

```
 self.description = "A description of the plugin"
```

```
 self.show_toolbar_button = True # Optional, defaults to False
```

```
 self.icon_file_name = os.path.join(os.path.dirname(__file__), 'icon.png') # Optional
```

```
 def Run(self):
```

```
 # The entry function of the plugin that is executed on user action
```

```
 print("Hello World")
```

----

The `__init__.py`` file is then used to instantiate and register the plugin to

Pcbnew as follows.

[source,python]

----

```
from .complex_plugin_action import ComplexPluginAction # Note the relative import!
ComplexPluginAction().register() # Instantiate and register to PCB editor

```

As described in <https://www.python.org/dev/peps/pep-0338/> [PEP 338] Python can execute packages (or modules) as scripts. This can be useful to implement a command-line stand-alone version of your KiCad plugin with minimum effort. In order to implement this feature, a `__main__.py` file is created in the package directory.

This file can be executed by running the following command.

```
python -m <package_name>
```

Make sure that your current directory is the parent directory of the package directory when running the command.

In these examples, this would be `~/kicad_plugins`.

When running the command the Python interpreter runs

`~/complex_plugin/__init__.py` followed by `~/complex_plugin/__main__.py`.

== Building KiCad from Source

If you are a user and not a developer, please consider using one of the prebuilt packages

of KiCad which can be found at the [https://kicad.org/download/\[download\]](https://kicad.org/download/[download]) page on the [https://kicad.org/\[K](https://kicad.org/[K)

This document contains the instructions on how to build KiCad

from source on the supported platforms. It is not intended as a guide for installing or building

link:./getting-started/#\_library\_dependencies[library dependencies]. Please consult your platforms docum

installing packages or the source code when building the library dependencies. Currently the

supported platforms are Windows Versions 7-10, just about any version of Linux, and macOS

10.14 or newer. You may be able to build KiCad on other platforms but it is not supported. On

Windows and Linux the [https://gcc.gnu.org/\[GNU GCC\]](https://gcc.gnu.org/[GNU GCC]) is the only supported compiler and on macOS <http://cl>

only supported compiler.

Resumo: --- title: Build Options weight: 17 summary: Summary of CMake build configuration options. --- These are the build options that can be passed to CMake during configuration. == All Platforms [cols="4,12,1",options="header"] |=== |Option |Description |Default |KICAD\_SCRIPTING\_W...

---

title: Build Options

weight: 17

summary: Summary of CMake build configuration options.

---

These are the build options that can be passed to CMake during configuration.

== All Platforms

[cols="4,12,1",options="header"]

|===

|Option

|Description

|Default

|KICAD\_SCRIPTING\_WXPYTHON

|Build wxPython implementation for wx interface building in Python and py.shell.

|ON

|KICAD\_INSTALL\_DEMOS

|Install KiCad demos and examples.

|ON

|KICAD\_BUILD\_QA\_TESTS

|Build software Quality assurance unit tests.

|ON

|KICAD\_SPICE

|Build KiCad with internal Spice simulator.

|ON

|KICAD\_BUILD\_I18N

|Build the translation language libraries

|OFF

|KICAD\_I18N\_UNIX\_STRICT\_PATH

|Install the language libraries to the standard UNIX install path of

  \${CMAKE\_INSTALL\_PREFIX}/share/locale

|OFF

|

BUILD\_SMALL\_DEBUG\_FILES

|In debug build: create smaller binaries. On Windows, binaries created by link option -g3 are  
  \*very large\* (more than 1Gb for Pcbnew, and more than 3Gb for the full KiCad suite). This  
  option create binaries using link option -g1 that create much smaller files, but there are  
  less info in debug (However the file names and line numbers are available).

|OFF

|MAINTAIN\_PNGS

|Allow build/rebuild bitmap icons used in menus from the corresponding .svg file. Set to  
  true if you are a PNG maintainer and have the required tools given in the  
  bitmaps\_png/CMakeLists.txt file.

|OFF

|KICAD\_IPC\_API

|Build KiCad with support for the IPC API server (requires the `nng` library)

|ON

|===

== Platform Specific

[cols="4,12,1",options="header"]

|===

|Option

|Description

|Default

|KICAD\_WIN32\_DPI\_AWARE

|Turn on DPI awareness for Windows builds only.

|OFF

|KICAD\_WIN32\_CONTEXT\_WINFIBER

|Use win32 fibers for libcontext.

|OFF

|KICAD\_USE\_EGL

|Build KiCad with EGL backend support for Wayland.

|OFF

|KICAD\_USE\_BUNDLED\_GLEW

|Use the bundled version of GLEW - only available when KICAD\_USE\_EGL is set.

|OFF

|===

== Developer Specific

[cols="4,12,1",options="header"]

|===

|Option

|Description

|Default

|KICAD\_SANITIZE\_ADDRESS

|Build KiCad with address sanitizer (ASan) options. +

WARNING: May cause errors with Gold, Lld, Mold linkers.

|OFF

|KICAD\_SANITIZE\_THREADS

|Build KiCad with thread sanitizer (TSan) options. +

WARNING: May cause errors with Gold, Lld, Mold linkers.

|OFF

|KICAD\_STDLIB\_DEBUG

|Build KiCad with libstdc++ debug flags enabled.

|OFF

|KICAD\_STDLIB\_LIGHT\_DEBUG

|Build KiCad with libstdc++ with -Wp,-D\_GLIBCXX\_ASSERTIONS flag enabled. +

Not as intrusive as KICAD\_STDLIB\_DEBUG

|OFF

|KICAD\_DRC\_PROTO

|Build the DRC prototype QA tool.

|OFF

|KICAD\_BUILD\_PNS\_DEBUG\_TOOL

|Build the P&S debugging/playground QA tool.

|OFF

|KICAD\_GAL\_PROFILE

|Enable profiling info for GAL.

|OFF

|KICAD\_USE\_VALGRIND

|Build KiCad with valgrind stack tracking enabled.

|OFF

|===

== Notes

=== Note 1

Python 3 is required to build KiCad. The path to Python is normally determined automatically by a CMake script, but if needed, `PYTHON\_EXECUTABLE` can be defined when invoking cmake

( use ``-DPYTHON_EXECUTABLE=<python path>`` ) to specify a particular Python binary.

#### === Note 2

These Symbols are always defined, and are not an option for cmake invocation:

##### `*COMPILING_DLL*`

This is a signal to `import_export.h`, and when present, toggles the interpretation of the `#defines` in that file. Its purpose should not be extended beyond this.

##### `*USE_KIWAY_DLLS*`

Comes from CMake as a user configuration variable, settable in the Cmake user interface. It decides if KiCad will be built with the `*.kiface` program modules.

##### `*BUILD_KIWAY_DLL*`

Comes from CMake, but at the 2nd tier, not the top tier. By 2nd tier, something like `pcbnew/CMakeLists.txt`, not `/CMakeLists.txt` is meant. It is not a user configuration variable. Instead, the 2nd tier `CMakeLists.txt` file looks at the top level ``USE_KIWAY_DLLS`` and decides how the object files under the 2nd tier's control will be built. If it decides it wants to march in lockstep with ``USE_KIWAY_DLLS``, then this local `CMakeLists.txt` file may pass a defined ``BUILD_KIWAY_DLL`` (singular) on the compiler command line to the pertinent set of compilation steps under its control.

#### === Note 3

When building with ``KICAD_BUILD_I18N`` on Linux systems, `gettext` needs the rule files ``shared-mime-info.its`` and ``metainfo.its`/`appdata.its`` to translate the Linux

metadata files.

title: Getting Started

weight: 10

---

### == Development Tools

Before you begin building KiCad, there are a few tools required in addition to your compiler. Some of these tools are required to build from source and some are optional.

#### === CMake Build Configuration Tool

<https://cmake.org>[CMake] is the build configuration and makefile generation tool used by KiCad. It is re

[#git,reftext=Git]

#### === Git Version Control System

The official source code repository is hosted on <https://gitlab.com>[GitLab] and requires <https://git-scm.com> the latest source. If you prefer to use <https://github.com>[GitHub] there is a read only mirror of the of KiCad repository. The previous official hosting location at <https://launchpad.net/kicad/>[Launchpad] is still a mirror. Changes should be submitted as [https://docs.gitlab.com/ee/user/project/merge\\_requests/creating\\_](https://docs.gitlab.com/ee/user/project/merge_requests/creating_merge_requests.html) will not review changes submitted on GitHub or Launchpad as those platforms are mirrors only.

#### === Doxygen Code Documentation Generator

The KiCad source code is documented using <https://www.doxygen.nl/index.html>[Doxygen] which parses the KiCad source and builds a dependency tree along with the source documentation into HTML. Doxygen is only required if you are going to build the KiCad documentation.

#### === SWIG Simplified Wrapper and Interface Generator

<http://www.swig.org/>[SWIG] is used to generate the Python scripting language extensions for KiCad. SWIG is required if you are not going to build the KiCad scripting extension.

## == Library Dependencies

This section includes a list of library dependencies required to build KiCad. It does not include any dependencies of the libraries. Please consult the library's documentation for any additional dependencies. Some of these libraries are optional depending on your build configuration. This is not a guide on how to install the library dependencies using your system's package management tools or how to build the library from source. Consult the appropriate documentation to perform these tasks.

### === wxWidgets Cross Platform GUI Library

<http://wxwidgets.org/>[wxWidgets] is the graphical user interface (GUI) library used by KiCad. As of version 7.0, KiCad is developed and tested against wxWidgets 3.2. The KiCad team will not perform testing or bugfixing against older versions of wxWidgets, and may inadvertently introduce changes that break compilation or function when building against older versions. We welcome patches to fix build issues against earlier versions of wxWidgets as long as these patches do not change functionality when compiling against more modern versions. These patches should be the minimum necessary to get KiCad working, rather than attempting to backport functionality from the newer wxWidgets API (unless doing so is trivial).

On macOS we use a custom fork of wxWidgets -- see the macOS build instructions for details.

### === Boost {cpp} Libraries

The <https://www.boost.org/>[Boost] {cpp} library version 1.71 or greater is required to build KiCad.

### === GLEW OpenGL Extension Wrangler Library

The <http://glew.sourceforge.net/>[OpenGL Extension Wrangler] is an OpenGL helper library used by the KiCad abstraction library (GAL) and is always required to build KiCad.

### === ZLib Library

The <http://www.zlib.net/>[ZLib] development library is used by KiCad to handle compressed 3d models (.stp) and is always required to build KiCad.

### === GLM OpenGL Mathematics Library

The <http://glm.g-truc.net/>[OpenGL Mathematics Library] is an OpenGL helper library used by the KiCad graph abstraction library (GAL) and is always required to build KiCad.

### === GLUT OpenGL Utility Toolkit Library

The <https://www.opengl.org/resources/libraries/glut/>[OpenGL Utility Toolkit] is an OpenGL helper library and abstraction library (GAL) and is always required to build KiCad.

### === Cairo 2D Graphics Library

The <http://cairographics.org/>[Cairo] 2D graphics library is used as a fallback rendering canvas when OpenGL is not available and is always required to build KiCad.

### === Python Programming Language

The <https://www.python.org/>[Python] programming language is used to provide scripting support to KiCad. It is

### === wxPython Library

The <http://wxpython.org/>[wxPython] library is used to provide a scripting console for Pcbnew. It needs to be installed unless the <<wxPython scripting>> build configuration option is disabled. When building KiCad with wxPython support, make sure the version of the wxWidgets library and the version of wxPython installed on your system are the same. Mismatched versions have been known to cause runtime issues.

### === Curl Multi-Protocol File Transfer Library

The <http://curl.haxx.se/libcurl/>[Curl Multi-Protocol File Transfer Library] is used to provide secure internet file transfer access for the Plugin and Content Manager.

[#libocct, ref=OpenCascade]

### === OpenCascade Library

<https://www.opencascade.com/content/overview>[Open CASCADE Technology (OCC)] is used to provide

support for loading and saving 3D model file formats such as STEP. KiCad requires OCC 7.5.0 or higher. When building OCC locally, use the option BUILD\_MODULE\_Draw=OFF to make building easier

```
[#ngspice,reftext=Ngspice]
```

```
==== Ngspice Library
```

The <https://sourceforge.net/projects/ngspice/>[Ngspice Library] is used to provide Spice simulation support in the KiCad editor. Make sure the version of ngspice library used was built with the `--with-ngshared` option. This library needs to be installed unless the Spice build option is disabled.

```
[#protobuf,reftext=Protobuf]
```

```
==== Protocol Buffers (protobuf)
```

The <https://protobuf.dev/>[protobuf] library is used to provide structured serialization of KiCad data for the IPC API. It is required even when the IPC API is not enabled, as it is also used as part of QA testing and is likely to be used in other applications in the future. KiCad requires protobuf version 3.x, and must be built with the same version of protobuf that is deployed as a library on the target system.

```
[#nng,reftext=NNG]
```

```
==== Nanomsg Next Generation (nng)
```

The <https://nng.nanomsg.org/>[nng] library is used to provide a communications channel between KiCad and third-party plugins and applications for the IPC API. It is required when KICAD\_IPC\_API is enabled.

```
== KiCad Build Configuration Options
```

KiCad has many build options that can be configured to build different options depending on the availability of support for each option on a given platform. This section documents these options and their default values.

```
=== IPC API
```

The KICAD\_IPC\_API option is used to enable the experimental IPC API server. When this option is enabled, the `<nng>` library must be available.

```
[#wxpython_scripting,reftext=wxPython scripting]
```

```
=== wxPython Scripting Support
```

The KICAD\_SCRIPTING\_WXPYTHON option is used to enable building the wxPython interface into Pcbnew including the wxPython console.

### === Integrated Spice simulator

The KICAD\_SPICE option is used to control if the Spice simulator interface for Eeschema is built. When this option is enabled, it requires <<ngspice>> to be available as a shared library. This option is enabled by default.

### === STEP/IGES support for the 3D viewer

The KICAD\_USE\_OCC is used for the 3D viewer plugin to support STEP and IGES 3D models. Build tools and plugins related to OpenCascade (OCC) are enabled with this option. When enabled it requires <<libocct>> to be available. This option is enabled by default.

### === Wayland EGL support

The KICAD\_USE\_EGL option switches the OpenGL backend from using X11 bindings to Wayland EGL bindings. This option is only relevant on Linux when running wxWidgets 3.1.5+ with the EGL backend of the wxGLCanvas (which is the default option, but can be disabled in the wxWidgets build).

By default, setting KICAD\_USE\_EGL will use a in-tree version of the GLEW library (that is compiled with the additional flags needed to run on an EGL canvas) statically linked into KiCad. If the system version of GLEW supports EGL (it must be compiled with the GLEW\_EGL flag), then it can be used instead by setting KICAD\_USE\_BUNDLED\_GLEW to OFF.

### === Windows HiDPI Support

The KICAD\_WIN32\_DPI\_AWARE option makes the Windows manifest file for KiCad use a DPI aware version, which tells Windows that KiCad wants Per Monitor V2 DPI awareness (requires Windows 10 version 1607 and later).

### === Development Analysis Tools

KiCad can be compiled with support for several features to aid in the catching and debugging of runtime memory issues

#### ==== Valgrind support

The KICAD\_USE\_VALGRIND option is used to enable Valgrind's stack annotation feature in the tool framework. This provides the ability for Valgrind to trace memory allocations and accesses in the tool framework and reduce the number of false positives reported. This option is disabled by default.

#### ==== {cpp} standard library debugging

KiCad provides two options to enable debugging assertions contained in the GCC {cpp} standard library: KICAD\_STDLIB\_DEBUG and KICAD\_STDLIB\_LIGHT\_DEBUG. Both these options are disabled by default, and only one should be turned on at a time with KICAD\_STDLIB\_DEBUG taking precedence.

The KICAD\_STDLIB\_LIGHT\_DEBUG option enables the light-weight standard library assertions by passing ``_GLIBCXX_ASSERTIONS`` into CXXFLAGS. This enables things such as bounds checking on strings, arrays and vectors, as well as null pointer checks for smart pointers.

The KICAD\_STDLIB\_DEBUG option enables the full set of standard library assertions by passing ``_GLIBCXX_DEBUG`` into CXXFLAGS. This enables full debugging support for the standard library.

#### ==== Address Sanitizer support

The KICAD\_SANITIZE\_ADDRESS option enables <https://clang.llvm.org/docs/AddressSanitizer.html> [Address Sanitizer (ASan)] support to trace memory allocations and accesses to identify problems. This option is disabled by default. The Address Sanitizer contains several runtime options to tailor its behavior that are described in more detail in its <https://github.com/google/sanitizers/wiki/AddressSanitizerFlags#documentation>.

Analogously, the KICAD\_SANITIZE\_THREADS option enables <https://clang.llvm.org/docs/ThreadSanitizer.html> [Thread Sanitizer (TSan)]. Its runtime options are described <https://github.com/google/sanitizers/wiki/ThreadSanitizerFlags#here>.

These options are not supported on all build systems, and are known to have problems when using MinGW. They may also cause errors when using a linker other than the GNU linker, for example Gold, Lld, Mold.

=== Demos and Examples

The KiCad source code includes some demos and examples to showcase the program. You can choose whether install them or not with the `KICAD_INSTALL_DEMOS` option. You can also select where to install them with the `KICAD_DEMOS` variable. On Linux the demos are installed in `$PREFIX/share/kicad/demos` by default.

### === Quality assurance (QA) unit tests

The `KICAD_BUILD_QA_TESTS` option allows building unit tests binaries for quality assurance as part of the default build. This option is enabled by default.

If this option is disabled, the QA binaries can still be built by manually specifying the target. For example, with ``make``:

- \* Build all QA binaries: ``make qa_all``
- \* Build a specific test: ``make qa_pcbnew``
- \* Build all unit tests: ``make qa_all_tests``
- \* Build all test tool binaries: ``make qa_all_tools``

For more information about testing KiCad, see [\[this page\]\(testing.md\)](#).

### === KiCad Build Version

The KiCad version string is defined by the output of ``git describe --dirty`` when git is available or the version string defined in `CMakeModules/KiCadVersion.cmake` with the value of `KICAD_VERSION_EXTRA` appended to the former. If the `KICAD_VERSION_EXTRA` variable is not defined, it is not appended to the version string. If the `KICAD_VERSION_EXTRA` variable is defined it is appended along with a leading `'-'` to the full version string as follows:

```
(KICAD_VERSION[-KICAD_VERSION_EXTRA])
```

The build script automatically creates the version string information from the `<<git>>` repository information as follows:

```
(5.0.0-rc2-dev-100-g5a33f0960)
```

```
|
```

output of "git describe --dirty" if git is available.

### === KiCad Config Directory

The default KiCad configuration directory is ``kicad``. On Linux this is located at ``~/.config/kicad``, on MSW, this is ``C:\Documents and Settings\username\Application Data\kicad`` and on MacOS, this is ``~/Library/Preferences/kicad``. Inside the configuration directory, subdirectories will be created for each KiCad minor version, meaning that multiple versions of KiCad can share the same directory.

The base configuration directory can be overridden by specifying the `KICAD_CONFIG_DIR` string at compile time.

NOTE: Setting `KICAD_CONFIG_DIR` should be considered deprecated as of KiCad 5.99, as the config directory is versioned and there should not be any need to set a custom directory.

### === Running from the Build Directory

Normally, KiCad needs to be installed before running in order to locate data files and shared libraries. Developers may be interested in running specific KiCad binaries from inside the build directory instead of installing, as this can sometimes be a faster way to test things. The environment variable ``KICAD_RUN_FROM_BUILD_DIR`` can be set in order to change how KiCad looks up paths for shared libraries, resources, and other data files. Note that setting this variable does not change how KiCad looks for symbol/footprint/3D model libraries.

### === Setting the path to Python

KiCad relies on a specific Python version on Windows and macOS. Normally, the path to this Python installation is set by the corresponding packaging scripts for those platforms, but in some situations, it can be preferable to set a custom Python interpreter for development or testing purposes. On Windows, you must set the environment variable ``KICAD_USE_EXTERNAL_PYTHONHOME`` in order for KiCad to use the ``PYTHONHOME`` environment variable instead of the default (hard-coded) path to Python. This is so that ``PYTHONHOME`` set on user machines does not inadvertently break KiCad. See the Windows build instructions for details on how to use this variable to run KiCad from the build directory.

### == Getting the KiCad Source Code

There are several ways to get the KiCad source. If you want to build the stable version you can download the source archive from the <https://gitlab.com/kicad/code/kicad/> repository. Use the

other archive program to extract the source on your system. If you are using tar, use the following command:

```
```sh
tar -xaf kicad_src_archive.tar.xz
```
```

If you are contributing directly to the KiCad project on GitLab, you can create a local copy on your machine by using the following command:

```
```sh
git clone https://gitlab.com/kicad/code/kicad.git
```
```

Here is a list of source links:

*Resumo: --- title: Linux weight: 11 summary: Instructions for Linux using gcc tags: ["linux"] --- == Building KiCad on Linux To perform a full build on Linux, run the following commands: [source,sh] `` cd <your kicad source mirror> mkdir -p build/release mkdir -p build/debug ...*

---

title: Linux

weight: 11

summary: Instructions for Linux using gcc

tags: ["linux"]

---

== Building KiCad on Linux

To perform a full build on Linux, run the following commands:

[source,sh]

```

cd <your kicad source mirror>

mkdir -p build/release

mkdir -p build/debug # Optional for debug build.

cd build/release

cmake -DCMAKE_BUILD_TYPE=RelWithDebInfo \

../..

make

sudo make install

```

If the CMake configuration fails, determine the missing dependencies (see <<Dependencies>>) and install them on your system.

[NOTE]

--

If CMake fails at finding Protobuf even after installing the dependencies, try enabling

`KICAD\_USE\_CMAKE\_FINDPROTOBUF`, i.e.:

```
[source,sh]
```

```
...
```

```
cmake -DCMAKE_BUILD_TYPE=RelWithDebInfo \
```

```
-DKICAD_USE_CMAKE_FINDPROTOBUF=ON \
```

```
../..
```

```
...
```

```
--
```

By default, CMake sets the install path on Linux to ``usr/local``.

Use the ``CMAKE_INSTALL_PREFIX`` option to specify a different install path.

We recommend using the ``RelWithDebInfo`` build type for personal release builds, as this will include debugging symbols that will give you more useful stack traces in case you encounter a crash.

Replace ``RelWithDebInfo`` with ``Debug`` for debug builds.

### === Dependencies

The distribution-specific packages that have to be installed to build KiCad can be found in the nightly package sources:

\* <https://gitlab.com/kicad/packaging/kicad-ubuntu-builder/kicad-daily-package/-/blob/dailybuild/debian/control>

\* <https://gitlab.com/kicad/packaging/kicad-fedora-builder/-/blob/master/templates/kicad-nightly.spec> [Fedora]

\* <https://aur.archlinux.org/cgit/aur.git/tree/PKGBUILD?h=kicad-nightly> [Arch Linux/Manjaro] (``depends`` and

### === Tips and Tricks

#### ==== Ninja

KiCad builds faster using the Ninja build system in place of ``make``. To use Ninja, you can specify Ninja output on your CMake command line:

```
[source,sh]
```

```
...
```

```
cmake -G Ninja -DCMAKE_BUILD_TYPE=RelWithDebInfo ../..
```

```
ninja
```

```
sudo ninja install
```

```
...
```

```
==== Linker
```

Build speed will be further improved by using a linker different than the default BFD linker (``ld``), for example ``gold`` (fast), ``lld`` (faster), or ``mold`` (fastest). To change the linker, specify it by passing the ``-fuse-ld=<linker name>`` flag via the ``-DCMAKE_CXX_FLAGS`` CMake option:

```
[source,sh]
```

```
...
```

```
cmake -G Ninja -DCMAKE_BUILD_TYPE=RelWithDebInfo -DCMAKE_CXX_FLAGS=-fuse-ld=lld ../../
```

```
...
```

GCC versions lower than 12.1.0 do not support ``-fuse-ld=mold``. Read

<https://github.com/rui314/mold#how-to-use> to learn how to use ``mold`` in that case.

Arquivo: KnowledgePack-20250920-1710\downloads\kicad-dev-docs\content\build\linux\ index.zh-cn.adoc

== Building KiCad on macOS

Building on macOS requires care, as specific versions of dependencies are required in order for all KiCad features to compile and work properly. To simplify this process, we strongly recommend that all macOS users use our <https://gitlab.com/kicad/packaging/kicad-mac-builder> [kicad-mac-builder] utility, which contains the toolchain that produces the official macOS release builds of KiCad.

This utility can be used to set up a development environment for KiCad even if you just wish to build the sources without creating a full release package (DMG containing the KiCad applications and libraries).

Building without ``kicad-mac-builder`` is possible but is not supported by the KiCad development team. If you wish to pursue this route, please use the latest state of the kicad-mac-builder repository for guidance as to which packages to install and how to configure and build them.

NOTE: KiCad requires a custom fork of wxWidgets on macOS to work properly. This fork is hosted at <https://gitlab.com/kicad/code/wxWidgets> [the KiCad GitLab]. Currently, the ``kicad/macos-wx-3.2`` branch should be used to build the master branch of KiCad. If you use ``kicad-mac-builder`` to set up your build environment, the correct version of wxWidgets will be downloaded and built for you automatically.

=== Prerequisites

As of version 7, KiCad requires macOS 11 or higher to build (the build outputs can be run on some older versions of macOS). KiCad supports Apple's arm64 architecture as well as x86\_64, and the

packaging scripts can produce a "universal binary" that will run on either architecture. You must take care to maintain a consistent architecture when building on arm64, which `kicad-mac-builder` will try to ensure for you. Building some of the dependencies for `arm64` and some for `x86\_64` will result in linker errors (or Python errors) later in the process.

=== Setting up development environment using kicad-mac-builder

This guide assumes you already have the appropriate Apple C++ development toolchain (Xcode) for your macOS release installed. See Apple's documentation for details on how to install Xcode or the Xcode command-line tools. `kicad-mac-builder` will not install this for you.

To obtain `kicad-mac-builder` and set up the KiCad build dependencies, run the following on an Apple arm64 machine:

```
[source,sh]
```

```
...
```

```
softwareupdate --install-rosetta --agree-to-license # only required if you did not already install rosetta
```

```
cd <your preferred working directory>
```

```
git clone https://gitlab.com/kicad/packaging/kicad-mac-builder.git
```

```
cd kicad-mac-builder
```

```
./ci/arm64-on-arm64/bootstrap-arm64-on-arm64.sh
```

```
WX_SKIP_DOXYGEN_VERSION_CHECK=1 ./build.py --arch arm64 --target setup-kicad-dependencies
```

```
...
```

Or, on an x86\_64 (Intel) machine:

```
[source,sh]
```

```
...
```

```
cd <your preferred working directory>
```

```
git clone https://gitlab.com/kicad/packaging/kicad-mac-builder.git
```

```
cd kicad-mac-builder
```

```
./ci/x86_64-on-x86_64/bootstrap-x86_64-on_x86_64.sh
```

```
WX_SKIP_DOXYGEN_VERSION_CHECK=1 ./build.py --arch x86_64 --target setup-kicad-dependencies
```

```
...
```

NOTE: The first command, `bootstrap.sh`, will install Homebrew if it is not already installed, and

install all the KiCad dependencies that are available as Homebrew packages. You may wish to manually install the required dependencies instead of running this script. If so, simply inspect the script to see the current list of required Homebrew packages to install. The example bootstrap scripts are used for native compilation on the two Apple architectures. There is also an `x86\_64-on-arm64` option that can be used for cross-compilation on arm64 machines.

**WARNING:** The bootstrapping scripts are designed to run in a "clean" installation of macOS on our CI build machines. If you already have Homebrew installed to a non-standard directory, do not run `bootstrap.sh`. Instead, inspect the script and adapt the commands in it to your environment. If you already have Python installed, especially if you use a tool like `pyenv` to manage Python versions, you must ensure that the `python3` that is found first on your `PATH` matches the target architecture you are building KiCad for.

At the end of the `kicad-mac-builder` build process, `build.py` will print a list of suggested CMake arguments to the terminal.

**\*\*It is recommended you save either the independent list of variables OR the toolchain file path. You will need these when configuring your KiCad build.\*\***

The use of the toolchain file means you only have to set `-DCMAKE_TOOLCHAIN_FILE=<path>` in the cmake arguments later. Future reruns of KMB will keep the toolchain file updated.

You can rerun build.py to get all the variables again at any time.

=== Building KiCad

Now you are ready to build KiCad itself. Run the following to obtain and build KiCad:

```
[source,sh]
```

```
...
```

```
cd <your preferred working directory>
```

```
git clone https://gitlab.com/kicad/code/kicad.git
```

```
cd kicad
```

```
mkdir -p build/release
```

```
mkdir build/debug # Optional for debug build.
```

```
cd build/release

cmake <arguments from kicad-mac-builder> ../../

make

make install

...
```

Paste in the arguments you saved from earlier after the ``cmake`` command. Note that you may want to inspect and modify some of the arguments before using them:

By default, ``kicad-mac-builder`` will set the ``CMAKE_INSTALL_PREFIX`` to `../build/kicad-dest`` inside your ``kicad-mac-builder`` directory. Edit the arguments provided by ``kicad-mac-builder`` if you want to install KiCad to a different location.

By default, ``kicad-mac-builder`` will set ``CMAKE_BUILD_TYPE`` to ``RelWithDebInfo`` to create an optimized release build with debugging symbols. Change this to ``Debug`` to create an unoptimized build that can be debugged using ``lldb``.

NOTE: We recommend using Ninja instead of ``make`` for faster builds. To do so, run ``brew install ninja`` and then add ``-G Ninja`` to your ``cmake`` arguments.

### === Running and debugging

On macOS, starting from 7.99 nightlies, you can set the ``KICAD_RUN_FROM_BUILD_DIR`` environment variable and launch any KiCad executable from the build directory for run or debug. This is generally done in the target launch configuration options of IDEs like CLion.

You can also create and run the entire app bundle by running ``make install`` (or ``ninja install``) to package ``KiCad.app`` and then launch that. You can use ``lldb`` to debug the application, or attach to a running copy.

The installed package will be self-signed by the installation process. This will allow it to run on the local machine, but this package cannot be distributed to other machines without triggering Apple's security measures.

### === Updating dependencies

At the moment, ``kicad-mac-builder`` is designed to run in a "clean-slate" environment and does not automatically handle dependency updates. From time to time, you may wish to update your KiCad build dependencies. To do so:

1. Run ``git pull`` inside your ``kicad-mac-builder`` folder to sync with KiCad upstream.
2. Delete the contents of the ``./build`` directory.
3. Re-run the ``setup-kicad-dependencies`` step as described above.

NOTE: It is possible to rebuild only certain dependencies by deleting certain folders inside the ``./build`` directory, however this is an advanced usage and will not be documented here. Inspect the ``cmake`` files inside the ``kicad-mac-builder`` subdirectory to figure out what to do.

== Building using Visual Studio (2019, 2022)

=== Environment Setup

==== Visual Studio

You must first install [https://visualstudio.microsoft.com/vs/\[Visual Studio\]](https://visualstudio.microsoft.com/vs/[Visual Studio]) with the **Desktop development**

Additionally, you'll need to make sure the optional component <https://docs.microsoft.com/en-us/cpp/build/>

==== vcpkg

KiCad uses vcpkg for dependencies and uses **manifest mode** to declare the dependencies and our kicad regis

. Obtain vcpkg for your system from <https://github.com/microsoft/vcpkg>

. In order to benefit from pre-built packages, checkout the specific vcpkg commit used by KiCad's contin

. Bootstrap vcpkg, so the vcpkg tool is installed

In summary, decide where you want vcpkg to be installed and run the following commands:

[source,powershell]

...

```
git clone https://github.com/microsoft/vcpkg.git
```

```
cd vcpkg
```

```
Replace commit hash with that defined as $vcpkgCommit of https://gitlab.com/kicad/packaging/kicad-win-b
git checkout ef7dbf94b9198bc58f45951adcf1f041fc5ea0
```

```
.\bootstrap-vcpkg.bat
```

```
...
```

```
=== KiCad Specific Setup
```

```
==== 1. Manual installation of SWIG
```

SWIG must be installed manually. Obtain the latest `swigwin` package from <https://sourceforge.net/projects/swig/files/swigwin/> (at the time of this writing, the latest is `swigwin-4.1.1`) and extract the zip file to a known location.

```
==== 2. Configuring NuGet package source
```

In order to benefit from pre-built packages that will significantly speed up your first build, you should

For this, you need the `nuget.exe` command line utility. This can be obtained at <https://www.nuget.org/download>

Go to the directory where your nuget.exe is located and run:

```
[source,powershell]
```

```
...
```

```
./nuget.exe sources add -Name kicad-gitlab -Source "https://gitlab.com/api/v4/projects/27426693/packages/generic"
```

```
...
```

NOTE: For this to work, you must ensure your local copy of vcpkg is checked out at the same commit as is r

```
==== 3. CMakeSettings.json
```

Contained in the build root is a `CMakeSettings.json.sample`

```
. Copy and rename this file to `CMakeSettings.json`
```

```
. Edit your renamed `CMakeSettings.json` to:
```

```
.. Update the `VcPkgDir` environment variable up top to match the location of your vcpkg clone.
```

```
.. Update the `SwigExePath` environment variable up top to match the location of where you extracted the S
```

```
[source,json]
```

```

```

```
{ "VcPkgDir": "D:/vcpkg/" },
...
{ "SwigExePath": "D:/swigwin-4.1.1/swig.exe" },

```

#### ==== 4. "Open Folder" in Visual Studio

- \* Launch Visual Studio (only after completing the above steps).

- \* When the initial wizard launches, select to **\*\*Open a local folder\*\***.

This is the correct way to make Visual Studio directly handle *\*CMake\** projects.

- \* Select the build root folder.

- \* Ensure ``x64-Debug`` build configuration is selected. This will start the cmake configuration process and

NOTE: If correctly configured, vcpkg should download the pre-built binaries of all dependencies from the Internet. However, if there are any differences in your build environment, this step will take a long time (several minutes). At some points, it might appear as if the process is stuck because the output window doesn't update for minutes.

- \* Wait until the "CMake in Visual Studio" tab appears and the CMake process finishes with the message ``CMake``

#### ==== 5. Running and debugging

Running or debugging KiCad directly from the build directory through Visual Studio requires that you set certain environment variables so that KiCad can find runtime dependencies and Python works. To configure the runtime environment for programs run from Visual Studio, edit the ``launch.vs.json`` file in the project root directory. To open this file, select Debug and Launch Settings for kicad from the Debug menu.

NOTE: If you have multiple launch configurations, for example to debug standalone pcbnew or eeschema in addition to kicad, you will need to configure each one separately.

The variable ``KICAD_RUN_FROM_BUILD_DIR`` must be present (it can be set to any value) to run from the build directory. Setting this variable allows KiCad to find dynamic libraries when running from the build directory.

The variable ``KICAD_USE_EXTERNAL_PYTHONHOME`` must be present (it can be set to any value) when running from either the build or the install directory, which allows you to specify ``PYTHONHOME`` in

the environment. Normally, KiCad on Windows uses a Python that is bundled and placed in a specific location by the installer, and when running from Visual Studio, Python will be in a different location.

The variable ``PYTHONHOME`` must be present and set to the location of the Python installed by vcpkg.

The variable ``PYTHONPATH`` must be present and set to include the paths to the ``pcbnew`` python module and the ``kicad_pyshell`` module. The former is built next to ``pcbnew.exe`` in the build directory, and the latter lives in the source tree in the ``scripting`` directory.

Use the ``env`` section of each configuration entry to set the required environment variables, including the path to the ``vcpkg`` installed packages directory, which will allow KiCad to find dynamic libraries from dependencies. For example, the below configuration allows running and debugging ``kicad.exe`` from the build directory.

Create this file as ``<kicad_source>/vs/launch.vs.json`` to have a baseline/working default launch configuration:

```
[source,json]
```

```
...
```

```
{
```

```
 "version": "0.2.1",
```

```
 "defaults": {},
```

```
 "configurations": [
```

 "PATH": "${cmake.buildRoot}\\vcpkg_installed\\x64-windows\\debug\\bin;${cmake.buildRoot}\\common;
 }
}
]
}
...

```

=== Visual Studio Extras

==== Trailing Whitespace Remover (Extension)

It is *\*highly recommended\** users install the link:<https://marketplace.visualstudio.com/items?itemName=Mad>

==== natvis definitions for libraries

Visual Studio supports defining decoders for objects in debug views.

You can find some useful ones here:

- <https://github.com/wxWidgets/wxWidgets/blob/master/misc/msvc/wxWidgets.natvis>
- [https://github.com/nlohmann/json/blob/develop/nlohmann\\_json.natvis](https://github.com/nlohmann/json/blob/develop/nlohmann_json.natvis)
- <https://github.com/Open-Cascade-SAS/OCCT/blob/master/dox/debug/occt.natvis>

Simply download the files and drop them into:

```
`%USERPROFILE%\Documents\Visual Studio 2022\Visualizers`
```

VS will load them after it starts up.

=== Advanced

WARNING: It is recommended to only try these changes after getting a basic configuration working using the

==== Binary caching

By default vcpkg will bundle up each dependency and store it in a *binary cache* which maintains copies of

The binary cache is located usually in %LOCALAPPDATA%\vcpkg\archives

If storage space consumed is a problem.

You may change the location of the binary cache by setting the environment variable `VCPKG\_DEFAULT\_BINARY\_

or

You may disable binary caching by setting the environment variable `VCPKG\_FEATURE\_FLAGS` with value `'-bin

==== Manifest mode

The KiCad repository is configured to use link:<https://learn.microsoft.com/en-us/vcpkg/users/manifests>[Ma

The benefits of using this is that it ensures the developer's dependencies always match that of the projec

The negative side of manifest mode is that whenever you update your version of visual studio or navigate

If this is deemed undesirable, it is possible to disable manifest mode locally by following these steps:

. Copy vcpkg-configuration.json from kicad root into your vcpkg root

. Manually run a vcpkg install command for all dependencies currently defined in the KiCad root `vcpkg.js

+

----

.\vcpkg.exe install --recurse --triplet x64-windows boost-algorithm boost-bimap boost-filesystem boost-fun

----

. {empty}

+

----

.\vcpkg upgrade --no-dry-run

----

. Set cmake variable `VCPKG\_MANIFEST\_MODE` to `OFF`

. Ensure launch.vs.json `PATH` and `PYTHONHOME` variables point to the vcpkg folder (instead of the one in

+

----

```
"PYTHONHOME": "C:\\PATH\\TO\\vcpkg_installed\\x64-windows\\tools\\python3",
"PYTHONPATH": "${cmake.buildRoot}\\pcbnew;${projectDir}\\scripting",
"PATH": "C:\\PATH\\TO\\vcpkg\\installed\\x64-windows\\debug\\bin;${env.PATH}",
```

----

. Delete cmake cache and reconfigure

WARNING: Disabling manifest mode means you have to manually ensure that the dependencies you have installed

=== Troubleshooting

==== vcpkg cannot finish installing a dependency

Antivirus software is known to block interim steps in the package build process. Try temporarily disabling

==== Error: Couldn't find the versions database file

If this occurs, a mismatch between vcpkg and registries occurred when it was checking your already installed

The easiest fix is to simply `Delete Cache and Reconfigure` under the Project menu option

== Building using MSYS2

WARNING: MSYS2 is the legacy build system for Windows due to KiCad's historical roots.

KiCad has switched to MSVC (Microsoft Visual Studio) from version 6.0 and onwards for development and release.

Building via MSYS2 is still possible but does not receive a high level of attention.

=== Setup

The <https://www.msys2.org/>[MSYS2] project provides packages for all of the required dependencies to build KiCad.

To setup the MSYS2

build environment, download and run the *\*MSYS2 64-bit Installer\** available from the msys2 home page.

After the installer is finished, update to the latest

package versions by running the ``msys2_shell.cmd`` file located in the MSYS2 install path and

running the command ``pacman -Syu``. If the msys2-runtime package is updated, close the shell

and run ``msys2_shell.cmd``.

=== Building

The following commands assume you are building for 64-bit Windows, and that you already have

the KiCad source code in a folder called ``kicad-source`` in your home directory. See below

for changes if you need to build for 32-bit instead. At the command prompt run the the

following commands:

[source,bash]

----

```
pacman -S base-devel \
 git \
 mingw-w64-ucrt-x86_64-cmake \
 mingw-w64-ucrt-x86_64-doxygen \
 mingw-w64-ucrt-x86_64-gcc \
 mingw-w64-ucrt-x86_64-python \
 mingw-w64-ucrt-x86_64-pkg-config \
 mingw-w64-ucrt-x86_64-swig \
 mingw-w64-ucrt-x86_64-boost \
 mingw-w64-ucrt-x86_64-cairo \
 mingw-w64-ucrt-x86_64-glew \
 mingw-w64-ucrt-x86_64-curl \
 mingw-w64-ucrt-x86_64-wxPython \
 mingw-w64-ucrt-x86_64-toolchain \
 mingw-w64-ucrt-x86_64-glm \
 mingw-w64-ucrt-x86_64-opencascade \
 mingw-w64-ucrt-x86_64-ngspice \
 mingw-w64-ucrt-x86_64-zlib \
 mingw-w64-ucrt-x86_64-libgit2 \
 mingw-w64-ucrt-x86_64-wxwidgets3.2-msw \
 mingw-w64-ucrt-x86_64-protobuf \
 mingw-w64-ucrt-x86_64-nng

cd kicad-source

mkdir -p build/release

mkdir build/debug # Optional for debug build.

cd build/release

cmake -DCMAKE_BUILD_TYPE=Release \
-G "MSYS Makefiles" \
 -DCMAKE_PREFIX_PATH=/ucrt64 \
 -DCMAKE_INSTALL_PREFIX=/ucrt64 \
 -DDEFAULT_INSTALL_PATH=/ucrt64 \
 -DOCC_INCLUDE_DIR=/ucrt64/include/opencascade \
 ../../..

make -j N install # Where N is the number of concurrent threads that your system can handle.
```

----

NOTE: Since `nng` has only provided packages for `CLANG64`, `CLANGARM64`, and `UCRT64` environments, this article recommends `UCRT64` as the building environment.

For 32-bit builds, run `mingw32.exe` and change `ucrt-x86\_64` to `i686` in the package names and change the paths in the cmake configuration from `/ucrt64` to `/mingw32`.

NOTE: msys2 has deprecated 32-bit support due to cygwin, it's upstream dependency eliminating 32-bit support.

For debug builds, run the cmake command with `-DCMAKE\_BUILD\_TYPE=Debug` from the `build/debug` folder.

### === MSYS2 with CLion

KiCad in combination with MSYS2 can be configured to be used with CLion to provide a nice IDE experience.

### ==== Toolchain Setup

First you must register MSYS2 as a toolchain, or namely, the compiler.

File > Preferences to open the Settings window.

Navigate to Build, Execution, Development and then the Toolchains page.

Add a new toolchain, and configure it as such

- \* Name: `MSYS2-MinGW64`
- \* Environment Path: `\mingw64\`
- \* CMake: `\mingw64\bin\cmake.exe`

All other fields will become automatically populated.

### ==== Project Setup

File > Open and select the folder containing the kicad source.

CLion may attempt to start CMake generation and fail, this is ok.

Open the Settings window again.

Navigate to Build, Execution, Development and then the CMake page.

These settings are saved to the project.

You want to create a Debug configuration as such

```
* Name: `Debug-MSYS2`
* Build-Type: `Debug`
* Toolchain: `MSYS2-MinGW64`
* CMake options:
 ``sh
 -G "MinGW Makefiles"
 -DCMAKE_PREFIX_PATH=/mingw64
 -DCMAKE_INSTALL_PREFIX=/mingw64
 -DDEFAULT_INSTALL_PATH=/mingw64
 ...
* Build-directory: `build/debug-msys2`
```

You may now trigger the "Reload CMake Cache" option in CLion to generate the cmake project

You should delete the "junk" build folder (usually name cmake-build-debug-xxxx) it may have created in the source before it was changed above. We change the build folder because we have a gitignore for `/build`

Warning: Receiving warning messages about Boost versions is normal.

### === Known MSYS2 Build Issues

There are some known issues that are specific to MSYS2. This section provides a list of the currently known issues when building KiCad using MSYS2.

### ==== wxwidgets 3.1

You get an error that wxwidgets 3.1 is not found

```

```
pacman -R mingw-w64-x86_64-wxwidgets
```

```
rm -rf build/release # change to your cmake cache folder
```

```
pacman -S mingw-w64-x86_64-wxmsw3.1
```

```

title: Plugins Framework

weight: 19

---

The KiCad plugin system is a framework for extending the capabilities of KiCad using shared libraries. One of the main advantages of using a plugin is that it is not necessary to rebuild the KiCad suite while developing a plugin; in fact, plugins can be built with the aid of a very small set of headers from the KiCad source tree. Removing the requirement to build KiCad during plugin development greatly increases productivity by ensuring that the developer only compiles code directly related to the plugin which is being developed and thus reducing the time required for each build and test cycle.

Plugins were initially developed for the 3D model viewer to make it possible to support more types of 3D models without requiring major changes to the KiCad source for each new model type supported. The plugin framework was later generalized so that in the future developers can create different classes of plugins. Currently only 3D plugins are implemented within KiCad but it is envisioned that a PCB plugin will eventually be developed to make it possible for users to implement data Importers and Exporters.

[[plugin-classes]]

== Plugin Classes

Plugins are divided into Plugin Classes since each plugin addresses problems in a specific domain and therefore requires an interface unique to that domain. For example, the 3D model plugins load 3D model data from files and translate that data into a format which

can be displayed by the 3D viewer. A PCB Import/Export plugin would take PCB data and export to other electrical or mechanical data formats, or translate a foreign format into a KiCad PCB. At the moment only the 3D Plugin Class has been developed and it will be the focus of this document.

Implementing a Plugin Class requires creating code within the KiCad source tree which manages the loading of plugin code. Within the KiCad source tree, the file ``plugins/ldr/pluginldr.h`` declares the base class for all plugin loaders. This class declares the most basic functions which we would expect to find in any KiCad plugin (boilerplate code) and its implementation provides basic checks on version compatibility between the plugin loader and the available plugins. The header ``plugins/ldr/3d/pluginldr3D.h`` declares a loader for the 3D Plugin Class. The loader is responsible for loading a given plugin and making its functions available to KiCad. Each instance of a plugin loader represents an actual plugin implementation and acts as a transparent bridge between KiCad and the plugin's features. The loader is not the only code required within KiCad to support plugins: we also need code to discover the plugins and code to invoke the functions of the plugins via the plugin loader. In the case of the 3D plugins the discovery and invocation functions are all contained within the `S3D_CACHE` class.

Plugin developers do not need to be concerned with the details of KiCad's internal code for managing plugins unless a new Plugin Class is being developed; a plugin only needs to define the functions declared by their specific plugin class. The header ``include/plugins/kicad_plugin.h`` declares the generic functions required of all KiCad plugins; these functions identify the Plugin Class, provide the name of the specific plugin, provide version information for the Plugin Class API, provide version information for the specific plugin, and provide a basic version compatibility check on the Plugin Class API. In brief, these functions are:

[source,c]

-----

/\* Return a UTF-8 string naming the Plugin Class \*/

char const\* GetKicadPluginClass( void );

/\* Return version information for the Plugin Class API \*/

void GetClassVersion( unsigned char\* Major, unsigned char\* Minor,  
                    unsigned char\* Patch, unsigned char\* Revision );

/\*

Return true if the version check implemented in the plugin  
determines that the given Plugin Class API is compatible.

\*/

bool CheckClassVersion( unsigned char Major,  
                        unsigned char Minor, unsigned char Patch, unsigned char Revision );

/\* Return the name of the specific plugin, for example "PLUGIN\_3D\_VRML" \*/

const char\* GetKicadPluginName( void );

/\* Return version information for the specific plugin \*/

void GetPluginVersion( unsigned char\* Major, unsigned char\* Minor,  
                        unsigned char\* Patch, unsigned char\* Revision );

-----

[[class-plugin-3d]]

=== Plugin Class: PLUGIN\_3D

The header ``include/plugins/3d/3d_plugin.h`` declares the functions  
which must be implemented by all 3D plugins and defines a number of  
functions which are required by the plugin and which the user must  
not reimplement. The defined functions which the user must not

reimplement are:

[source,c]

-----

```

/* Returns the Plugin Class name "PLUGIN_3D" */
char const* GetKicadPluginClass(void);

/* Return version information for the PLUGIN_3D API */
void GetClassVersion(unsigned char* Major, unsigned char* Minor,
 unsigned char* Patch, unsigned char* Revision);

/*
 Performs basic version checks enforced by the developers of
 the loader for the PLUGIN_3D class and returns true if the
 checks pass
*/
bool CheckClassVersion(unsigned char Major, unsigned char Minor,
 unsigned char Patch, unsigned char Revision);

The functions which the user must implement are as follows:
[source,c]

/* Return the number of extension strings supported by the plugin */
int GetNExtensions(void);

/*
 Return the requested extension string; valid values are 0 to
 GetNExtensions() - 1
*/
char const* GetModelExtension(int aIndex);

/* Return the total number of file filters supported by the plugin */
int GetNFilters(void);

/*
 Return the file filter requested; valid values are 0 to
 GetNFilters() - 1
*/
char const* GetFileFilter(int aIndex);

```

```

/*
 Return true if the plugin can render this type of 3D model.

 In some cases a plugin may not yet provide a visual model
 and must return false.

*/
bool CanRender(void);

/* Load the specified model and return a pointer to its visual model data */
SCENEGRAPH* Load(char const* aFileName);

```

## == Tutorials: 3D Plugin Class

This section contains a description of two very simple plugins of the `PLUGIN_3D` class and walks the user through the setup and building of the code.

### [[basic-3d-plugin]]

#### === Basic 3D Plugin

This tutorial walks the user through the development of a very basic 3D plugin named "PLUGIN\_3D\_DEM01". The purpose of this tutorial is only to demonstrate the construction of a very basic 3D plugin which does nothing other than provide a few filter strings which permit the KiCad user to filter file names while browsing for 3D models. The code demonstrated here is the absolute minimum requirement for any 3D plugin and can be used as a template for creating more advanced plugins.

In order to build the demo project we require the following:

- \* <https://cmake.org/>[CMake]
- \* KiCad plugin headers

\* KiCad Scene Graph library `kicad\_3dsg`

To automatically detect the KiCad headers and library we shall use a CMake FindPackage script; the script supplied in this tutorial should work on Linux and Windows if the relevant header files are installed to `\${KICAD\_ROOT\_DIR}/kicad` and the KiCad Scene Graph library is installed in `\${KICAD\_ROOT\_DIR}/lib`.

To start let's create a project directory and the FindPackage script:

```
[source,bash]
```

```

```

```
mkdir demo && cd demo
```

```
export DEMO_ROOT=${PWD}
```

```
mkdir CMakeModules && cd CMakeModules
```

```
cat > FindKICAD.cmake << _EOF
```

```
find_path(KICAD_INCLUDE_DIR kicad/plugins/kicad_plugin.h
```

```
 PATHS ${KICAD_ROOT_DIR}/include $ENV{KICAD_ROOT_DIR}/include
```

```
 DOC "Kicad plugins header path."
```

```
)
```

```
if(NOT ${KICAD_INCLUDE_DIR} STREQUAL "KICAD_INCLUDE_DIR-NOTFOUND")
```

```
 # attempt to extract the version information from sg_version.h
```

```
 find_file(KICAD_SGVERSION sg_version.h
```

```
 PATHS ${KICAD_INCLUDE_DIR}
```

```
 PATH_SUFFIXES kicad/plugins/3dapi
```

```
 NO_DEFAULT_PATH)
```

```
 if(NOT ${KICAD_SGVERSION} STREQUAL "KICAD_SGVERSION-NOTFOUND")
```

```
 # extract the "#define KICADSG_VERSION*" lines
```

```
 file(STRINGS ${KICAD_SGVERSION} _version REGEX "^#define.*KICADSG_VERSION.*")
```

```
 foreach(SVAR ${_version})
```

```

 string(REGEX MATCH KICADSG_VERSION_[M,A,J,O,R,I,N,P,T,C,H,E,V,I,S]* _VARNAME ${SVAR})
 string(REGEX MATCH [0-9]+ _VALUE ${SVAR})

 if(NOT ${_VARNAME} STREQUAL "" AND NOT ${_VALUE} STREQUAL "")
 set($_${_VARNAME} ${_VALUE})
 endif()

 endforeach()

 #ensure that NOT SG3D_VERSION* will evaluate to '0'
 if(NOT _KICADSG_VERSION_MAJOR)
 set(_KICADSG_VERSION_MAJOR 0)
 endif()

 if(NOT _KICADSG_VERSION_MINOR)
 set(_KICADSG_VERSION_MINOR 0)
 endif()

 if(NOT _KICADSG_VERSION_PATCH)
 set(_KICADSG_VERSION_PATCH 0)
 endif()

 if(NOT _KICADSG_VERSION_REVISION)
 set(_KICADSG_VERSION_REVISION 0)
 endif()

 set(KICAD_VERSION ${_KICADSG_VERSION_MAJOR}.${_KICADSG_VERSION_MINOR}.${_KICADSG_VERSION_PATCH}.
 unset(KICAD_SGVERSION CACHE)
endif()
endif()

find_library(KICAD_LIBRARY

 NAMES kicad_3dsg

 PATHS

```

```

 ${KICAD_ROOT_DIR}/lib $ENV{KICAD_ROOT_DIR}/lib

 ${KICAD_ROOT_DIR}/bin $ENV{KICAD_ROOT_DIR}/bin

DOC "Kicad scenegraph library path."

)

include(FindPackageHandleStandardArgs)

FIND_PACKAGE_HANDLE_STANDARD_ARGS(KICAD

 REQUIRED_VARS

 KICAD_INCLUDE_DIR

 KICAD_LIBRARY

 KICAD_VERSION

 VERSION_VAR KICAD_VERSION)

mark_as_advanced(KICAD_INCLUDE_DIR)

set(KICAD_VERSION_MAJOR ${_KICADSG_VERSION_MAJOR} CACHE INTERNAL "")
set(KICAD_VERSION_MINOR ${_KICADSG_VERSION_MINOR} CACHE INTERNAL "")
set(KICAD_VERSION_PATCH ${_KICADSG_VERSION_PATCH} CACHE INTERNAL "")
set(KICAD_VERSION_TWEAK ${_KICADSG_VERSION_REVISION} CACHE INTERNAL "")

_EOF

```

Kicad and its plugin headers must be installed; if they are installed to a user directory or under `/opt` on Linux, or you are using Windows, you will need to set the `KICAD\_ROOT\_DIR` environment variable to point to the directory containing the KiCad `include` and `lib` directories. For OS X the FindPackage script presented here may require some adjustments.

To configure and build the tutorial code we will use CMake and create a `CMakeLists.txt` script file:

```

[source,bash]

```

```

cd ${DEMO_ROOT}

cat > CMakeLists.txt << _EOF

declare the name of the project

project(PLUGIN_DEMO)

check that we have a version of CMake with all required features

cmake_minimum_required(VERSION 2.8.12 FATAL_ERROR)

inform CMake of where to find the FindKICAD script

set(CMAKE_MODULE_PATH ${PROJECT_SOURCE_DIR}/CMakeModules)

attempt to discover the installed kicad headers and library

and set the variables:

KICAD_INCLUDE_DIR

KICAD_LIBRARY

find_package(KICAD 1.0 REQUIRED)

add the kicad include directory to the compiler's search path

include_directories(${KICAD_INCLUDE_DIR}/kicad)

create a plugin named s3d_plugin_demo1

add_library(s3d_plugin_demo1 MODULE

 src/s3d_plugin_demo1.cpp

)

```

\_EOF

-----

The first demo project is very basic; it consists of a single file with no external link dependencies other than the compiler defaults. We start by creating a source directory:

[source,bash]

-----

```
cd ${DEMO_ROOT}
```

```
mkdir src && cd src
export DEMO_SRC=${PWD}

```

Now we create the plugin source itself:

```
.s3d_plugin_demo1.cpp
[source,c]

#include <iostream>

// the 3d_plugin.h header defines the functions required of 3D plugins
#include "plugins/3d/3d_plugin.h"

// define the version information of this plugin; do not confuse this
// with the Plugin Class version which is defined in 3d_plugin.h
#define PLUGIN_3D_DEM01_MAJOR 1
#define PLUGIN_3D_DEM01_MINOR 0
#define PLUGIN_3D_DEM01_PATCH 0
#define PLUGIN_3D_DEM01_REVNO 0

// implement the function which provides users with this plugin's name
const char* GetKicadPluginName(void)
{
 return "PLUGIN_3D_DEM01";
}

// implement the function which provides users with this plugin's version
void GetPluginVersion(unsigned char* Major, unsigned char* Minor,
 unsigned char* Patch, unsigned char* Revision)
{
 if(Major)
 *Major = PLUGIN_3D_DEM01_MAJOR;
 if(Minor)
 *Minor = PLUGIN_3D_DEM01_MINOR;
```

```

 if(Patch)

 *Patch = PLUGIN_3D_DEM01_PATCH;

 if(Revision)

 *Revision = PLUGIN_3D_DEM01_REVNO;
return;
}

// number of extensions supported; on *NIX systems the extensions are
// provided twice - once in lower case and once in upper case letters
#ifdef _WIN32

 #define NEXTS 7

#else

 #define NEXTS 14

#endif

// number of filter sets supported

#define NFILS 5

// define the extension strings and filter strings which this
// plugin will supply to the user
static char ext0[] = "wrl";
static char ext1[] = "x3d";
static char ext2[] = "emn";
static char ext3[] = "iges";
static char ext4[] = "igs";
static char ext5[] = "stp";

#ifdef _WIN32

 extensions[7] = ext7;

 extensions[8] = ext8;

 extensions[9] = ext9;

 extensions[10] = ext10;

 extensions[11] = ext11;

 extensions[12] = ext12;

 extensions[13] = ext13;

#endif

 return;

 }

} file_data;

// return the number of extensions supported by this plugin
int GetNExtensions(void)
{
 return NEXTS;
}

// return the indexed extension string
char const* GetModelExtension(int aIndex)
{
 if(aIndex < 0 || aIndex >= NEXTS)
 return NULL;

 return file_data.extensions[aIndex];
}

// return the number of filter strings provided by this plugin
int GetNFilters(void)

```

```

{
 return NFILS;
}

// return the indexed filter string
char const* GetFileFilter(int aIndex)
{
 if(aIndex < 0 || aIndex >= NFILS)
 return NULL;

 return file_data.filters[aIndex];
}

// return false since this plugin does not provide visualization data
bool CanRender(void)
{
 return false;
}

// return NULL since this plugin does not provide visualization data
SCENEGRAPH* Load(char const* aFileName)
{
 // this dummy plugin does not support rendering of any models
 return NULL;
}

```

This source file meets all the minimum requirements to implement a 3D plugin. The plugin does not produce any data for rendering models but it can provide KiCad with a list of supported model file extensions and file extension filters to enhance the 3D model file selection dialog. Within KiCad the extension strings are used to select the plugins which may be used to load a specified model; for example, if the plugin is `wrl` then KiCad will invoke each plugin which claims to support the extension

`wrl` until a plugin returns visualization data. The file filters provided by each plugin are passed to the 3D file selector dialog to improve the browsing UI.

To build the plugin:

```
[source,bash]
```

```

```

```
cd ${DEMO_ROOT}
```

```
export KICAD_ROOT_DIR if necessary
```

```
mkdir build && cd build
```

```
cmake .. && make
```

```

```

The plugin will be built but not installed; you must copy the plugin file to KiCad's plugin directory if you wish to load the plugin.

```
[[advanced-3d-plugin]]
```

```
=== Advanced 3D Plugin
```

This tutorial walks the user through the development of a 3D plugin named "PLUGIN\_3D\_DEM02". The purpose of this tutorial is to demonstrate the construction of a very basic scene graph which the KiCad previewer can render. The plugin claims to handle files of type `txt`. Although the file must exist in order for the cache manager to invoke the plugin, the file contents are not processed by this plugin; instead, the plugin simply creates a scene graph containing a pair of tetrahedra. This tutorial assumes that the first tutorial had been completed and that the CMakeLists.txt and FindKICAD.cmake script files have been created.

Place the new source file in the same directory as the previous

tutorial's source file and we will extend the previous tutorial's CMakeLists.txt file to build this tutorial. Since this plugin will

create a scene graph for KiCad we need to link to KiCad's scene graph library `kicad\_3dsg`. KiCad's Scene Graph Library provides a set of classes which can be used to build the Scene Graph Object; the Scene Graph Object is an intermediate data visualization format used by the 3D Cache Manager. All plugins which support model visualization must translate the model data into a scene graph via this library.

The first step is to extend `CMakeLists.txt` to build this tutorial project:  
[source,bash]

```

cd ${DEMO_ROOT}

cat >> CMakeLists.txt << _EOF
add_library(s3d_plugin_demo2 MODULE
 src/s3d_plugin_demo2.cpp
)

target_link_libraries(s3d_plugin_demo2 ${KICAD_LIBRARY})
_EOF

```

Now we change to the source directory and create the source file:

```
[source,bash]

cd ${DEMO_SRC}

.s3d_plugin_demo2.cpp
[source,c]

#include <cmath>

// 3D Plugin Class declarations
#include "plugins/3d/3d_plugin.h"

// interface to KiCad Scene Graph Library
```

```

#include "plugins/3dapi/ifsg_all.h"

// version information for this plugin

#define PLUGIN_3D_DEM02_MAJOR 1
#define PLUGIN_3D_DEM02_MINOR 0
#define PLUGIN_3D_DEM02_PATCH 0
#define PLUGIN_3D_DEM02_REVNO 0

// provide the name of this plugin
const char* GetKicadPluginName(void)
{
 return "PLUGIN_3D_DEM02";
}

// provide the version of this plugin
void GetPluginVersion(unsigned char* Major, unsigned char* Minor,
 unsigned char* Patch, unsigned char* Revision)
{
 if(Major)
 *Major = PLUGIN_3D_DEM02_MAJOR;

 if(Minor)
 *Minor = PLUGIN_3D_DEM02_MINOR;

 if(Patch)
 *Patch = PLUGIN_3D_DEM02_PATCH;

 if(Revision)
 *Revision = PLUGIN_3D_DEM02_REVNO;

 return;
}
// number of extensions supported
#ifdef _WIN32
#define NEXTS 1

```

```

#else

#define NEXTS 2

#endif

// number of filter sets supported

#define NFILS 1

static char ext0[] = "txt";

#ifdef _WIN32

static char fil0[] = "demo (*.txt)|*.txt";

#else

static char ext1[] = "TXT";

static char fil0[] = "demo (*.txt;*.TXT)|*.txt;*.TXT";

#endif

static struct FILE_DATA
{
 char const* extensions[NEXTS];

 char const* filters[NFILS];

 FILE_DATA()
 {
 extensions[0] = ext0;

 filters[0] = fil0;

#ifdef _WIN32

 extensions[1] = ext1;

#endif

 return;

 }
} file_data;
int GetNExtensions(void)
{

```

```

 return true;
}

// create the visualization data
SCENEGRAPH* Load(char const* aFileName)

```

```

{
 // For this demonstration we create a tetrahedron (tx1) consisting
 // of a SCENEGRAPH (VRML Transform) which in turn contains 4
 // SGSHAPE (VRML Shape) objects representing each of the sides of
 // the tetrahedron. Each Shape is associated with a color (SGAPPEARANCE)
 // and a SGFACESET (VRML Geometry->indexedFaceSet). Each SGFACESET is
 // associated with a vertex list (SGCOORDS), a per-vertex normals
 // list (SGNORMALS), and a coordinate index (SGCOORDINDEX). One shape
 // is used to represent each face so that we may use per-vertex-per-face
 // normals.
 //
 // The tetrahedron in turn is a child of a top level SCENEGRAPH (tx0)
 // which has a second SCENEGRAPH child (tx2) which is a transformation
 // of the tetrahedron tx1 (rotation + translation). This demonstrates
 // the reuse of components within the scene graph hierarchy.

 // define the vertices of the tetrahedron
 // face 1: 0, 3, 1
 // face 2: 0, 2, 3
 // face 3: 1, 3, 2
 // face 4: 0, 1, 2
 double SQ2 = sqrt(0.5);
 SGPOINT vert[4];
 vert[0] = SGPOINT(1.0, 0.0, -SQ2);
 vert[1] = SGPOINT(-1.0, 0.0, -SQ2);
 vert[2] = SGPOINT(0.0, 1.0, SQ2);
 vert[3] = SGPOINT(0.0, -1.0, SQ2);

 // create the top level transform; this will hold all other
 // scenegraph objects; a transform may hold other transforms and
 // shapes
 IFSG_TRANSFORM* tx0 = new IFSG_TRANSFORM(true);
 // create the transform which will house the shapes
 IFSG_TRANSFORM* tx1 = new IFSG_TRANSFORM(tx0->GetRawPtr());

```

```

// add a shape which we will use to define one face of the tetrahedron;

// shapes hold facesets and appearances

IFSG_SHAPE* shape = new IFSG_SHAPE(*tx1);
// add a faceset; these contain coordinate lists, coordinate indices,

// vertex lists, vertex indices, and may also contain color lists and

// their indices.

IFSG_FACESET* face = new IFSG_FACESET(*shape);

IFSG_COORDS* cp = new IFSG_COORDS(*face);

cp->AddCoord(vert[0]);
cp->AddCoord(vert[3]);
cp->AddCoord(vert[1]);

// coordinate indices - note: enforce triangles;
// in real plugins where it is not necessarily possible
// to determine which side a triangle is visible from,
// 2 point orders must be specified for each triangle
IFSG_COORDINDEX* coordIdx = new IFSG_COORDINDEX(*face);
coordIdx->AddIndex(0);
coordIdx->AddIndex(1);
coordIdx->AddIndex(2);

// create an appearance; appearances are owned by shapes

// magenta
IFSG_APPEARANCE* material = new IFSG_APPEARANCE(*shape);
material->SetSpecular(0.1, 0.0, 0.1);
material->SetDiffuse(0.8, 0.0, 0.8);
material->SetAmbient(0.2, 0.2, 0.2);
material->SetShininess(0.2);

// normals
IFSG_NORMALS* np = new IFSG_NORMALS(*face);

 delete tx0;

 delete tx1;

 delete tx2;

 return (SCENEGRAPH*)data;
}

```

## == Application Programming Interface (API)

Plugins are implemented via Application Programming Interface (API) implementations. Each Plugin Class has its specific API and in the 3D Plugin tutorials we have seen examples of the implementation of the 3D Plugin API as declared by the header ``3d_plugin.h``. Plugins may also rely on other APIs defined within the KiCad source tree; in the case of 3D plugins, all plugins which support visualization of models must interact with the Scene Graph API as declared in the header ``ifsg_all.h`` and its included headers.

This section describes the details of available Plugin Class APIs and other KiCad APIs which may be required for implementations of plugin classes.

## === Plugin Class APIs

There is currently only one plugin class declared for KiCad: the 3D Plugin Class. All KiCad plugin classes must implement

a basic set of functions declared in the header file ``kicad_plugin.h``; these declarations are referred to as the Base Kicad Plugin Class.

No implementation of the Base Kicad Plugin Class exists; the header file exists purely to ensure that plugin developers implement these defined functions in each plugin implementation. Within KiCad, each instance of a Plugin Loader implements the API presented by a plugin as though the Plugin Loader is a class providing the plugin's services. This is achieved by the Plugin Loader class providing a public interface containing function names which are similar to those implemented by the plugin; the argument lists may vary to accommodate the need to inform the user of any problems which may be encountered if, for example, no plugin is loaded. Internally the Plugin Loader uses a stored pointer to each API function to invoke each function on behalf of the user.

#### ==== API: Base Kicad Plugin Class

The Base Kicad Plugin Class is defined by the header file ``kicad_plugin.h``. This header must be included in the declaration of all other plugin classes; for an example see the 3D Plugin Class declaration in the header file ``3d_plugin.h``. The prototypes for these functions were briefly described in <<plugin-classes,Plugin Classes>>. The API is implemented by the base plugin loader as defined in ``pluginldr.cpp``.

To help make sense of the functions required by the base KiCad plugin header we must look at what happens in the base Plugin Loader class. The Plugin Loader class declares a virtual function ``Open()`` which takes the full path to the plugin to be loaded. The implementation of the ``Open()`` function within a specific plugin class loader will initially invoke the protected ``open()`` function of the base plugin loader; this base ``open()`` function attempts to find the address of each of the required basic plugin functions; once the addresses of each function have been retrieved, a number of checks are enforced:

- . Plugin ``GetKicadPluginClass()`` is invoked and the result is compared to the Plugin Class string provided by the Plugin Loader implementation; if

these strings do not match then the opened plugin is not intended for the Plugin Loader instance.

- . Plugin ``GetClassVersion()`` is invoked to retrieve the Plugin Class API Version implemented by the plugin.
- . Plugin Loader virtual ``GetLoaderVersion()`` function is invoked to retrieve the Plugin Class API Version implemented by the loader.
- . The Plugin Class API Version reported by the plugin and the loader are required to have the same Major Version number, otherwise they are considered incompatible. This is the most basic version test and it is enforced by the base plugin loader.
- . Plugin ``CheckClassVersion()`` is invoked with the Plugin Class API Version information of the Plugin Loader; if the Plugin supports the given version then it returns ``true`` to indicate success. If successful the loader creates a `PluginInfo` string based on the results of ``GetKicadPluginName()`` and ``GetPluginVersion()``, and the plugin loading procedure continues within the Plugin Loader's ``Open()`` implementation.

#### ==== API: 3D Plugin Class

The 3D Plugin Class is declared by the header file ``3d_plugin.h`` and it extends the required plugin functions as described in `<<class-plugin-3d,Plugin Class: PLUGIN_3D>>`. The corresponding Plugin Loader is defined in ``pluginldr3D.cpp`` and the loader implements the following public functions in addition to the required API functions:

[source,c]

-----

```
/* Open the plugin specified by the full path "aFullFileName" */
```

```
bool Open(const wxString& aFullFileName);
```

```
/* Close the currently opened plugin */
```

```
void Close(void);
```

```
/* Retrieve the Plugin Class API Version implemented by this Plugin Loader */
```

```
void GetLoaderVersion(unsigned char* Major, unsigned char* Minor,
 unsigned char* Revision, unsigned char* Patch) const;

```

The required 3D Plugin Class functions are exposed via the following functions:

```
[source,c]
```

```

```

```
/* returns the Plugin Class or NULL if no plugin loaded */
```

```
char const* GetKicadPluginClass(void);
```

```
/* returns false if no plugin loaded */
```

```
bool GetClassVersion(unsigned char* Major, unsigned char* Minor,
 unsigned char* Patch, unsigned char* Revision);
```

```
/* returns false if the class version check fails or no plugin is loaded */
```

```
bool CheckClassVersion(unsigned char Major, unsigned char Minor,
 unsigned char Patch, unsigned char Revision);
```

```
/* returns the Plugin Name or NULL if no plugin loaded */
```

```
const char* GetKicadPluginName(void);
```

```
/*
```

```
 returns false if no plugin is loaded, otherwise the arguments
 contain the result of GetPluginVersion()
```

```
*/
```

```
bool GetVersion(unsigned char* Major, unsigned char* Minor,
 unsigned char* Patch, unsigned char* Revision);
```

```
/*
```

```
 sets aPluginInfo to an empty string if no plugin is loaded,
 otherwise aPluginInfo is set to a string of the form:
```

```
[NAME]:[MAJOR].[MINOR].[PATCH].[REVISION] where
NAME = name provided by GetKicadPluginClass()
```

```

 MAJOR, MINOR, PATCH, REVISION = version information from
 GetPluginVersion()

*/

void GetPluginInfo(std::string& aPluginInfo);

```

In typical situations, the user would do the following:

- . Create an instance of `KICAD\_PLUGIN\_LDR\_3D`.
- . Invoke `Open( "/path/to/myplugin.so" )` to open a specific plugin.  
The return value must be checked to ensure that the plugin loaded as desired.
- . Invoke any of the 3D Plugin Class calls as exposed by `KICAD\_PLUGIN\_LDR\_3D`.
- . Invoke `Close()` to close (unlink) the plugin.
- . Destroy the `KICAD\_PLUGIN\_LDR\_3D` instance.

#### === Scenegraph Class APIs

The Scenegraph Class API is defined by the header `ifsg\_all.h` and its included headers. The API consists of a number of helper routines with the namespace `S3D` as defined in `ifsg\_api.h` and wrapper classes defined by the various `ifsg\_\*.h` headers; the wrappers support the underlying scene graph classes which, taken together, form a scene graph structure which is compatible with VRML2.0 static scene graphs. The headers, structures, classes and their public functions are as follows:

```

.sg_version.h

[source,c]

/*

 Defines version information of the SceneGraph Classes.

 All plugins which use the scenegraph class should include this header
 and check the version information against the version reported by
 S3D::GetLibVersion() to ensure compatibility

*/

#define KICADSG_VERSION_MAJOR 2
#define KICADSG_VERSION_MINOR 0

```

```
#define KICADSG_VERSION_PATCH 0
```

```
#define KICADSG_VERSION_REVISION 0
```

```

```

```
.sg_types.h
```

```
[source,c]
```

```

```

```
/*
```

```
 Defines the SceneGraph Class Types; these types
 are closely related to VRML2.0 node types.
```

```
*/
```

```
namespace S3D
```

```
{
```

```
 enum SGTYPES
```

```
 {
```

```
 SGTYPE_TRANSFORM = 0,
```

```
 SGTYPE_APPEARANCE,
```

```
 SGTYPE_COLORS,
```

```
 SGTYPE_COLORINDEX,
```

```
 SGTYPE_FACESET,
```

```
 SGTYPE_COORDS,
```

```
 SGTYPE_COORDINDEX,
```

```
 SGTYPE_NORMALS,
```

```
 SGTYPE_SHAPE,
```

```
 SGTYPE_END
```

```
 };
```

```
};
```

```

```

The `sg\_base.h` header contains declarations of basic data types used

by the scenegraph classes.

```
.sg_base.h
```

```
[source,c]
```

```

/*
 This is an RGB color model equivalent to the VRML2.0
 RGB model where each color may have a value within the

 range [0..1].

*/

class SGCOLOR
{
public:
 SGCOLOR();

 SGCOLOR(float aRVal, float aGVal, float aBVal);

 void GetColor(float& aRedVal, float& aGreenVal, float& aBlueVal) const;
 void GetColor(SGCOLOR& aColor) const;
 void GetColor(SGCOLOR* aColor) const;

 bool SetColor(float aRedVal, float aGreenVal, float aBlueVal);
 bool SetColor(const SGCOLOR& aColor);
 bool SetColor(const SGCOLOR* aColor);
};

class SGPOINT
{
public:
 double x;
 double y;
 double z;

public:
 SGPOINT();

 SGPOINT(double aXVal, double aYVal, double aZVal);

 void GetPoint(double& aXVal, double& aYVal, double& aZVal);

```

```

 void GetPoint(SGPOINT& aPoint);
 void GetPoint(SGPOINT* aPoint);

 void SetPoint(double aXVal, double aYVal, double aZVal);
 void SetPoint(const SGPOINT& aPoint);
};

/*
 A SGVECTOR has 3 components (x,y,z) similar to a point; however
 a vector ensures that the stored values are normalized and
 prevents direct manipulation of the component variables.
*/
class SGVECTOR
{
public:
 SGVECTOR();
 SGVECTOR(double aXVal, double aYVal, double aZVal);

 void GetVector(double& aXVal, double& aYVal, double& aZVal) const;

 void SetVector(double aXVal, double aYVal, double aZVal);
 void SetVector(const SGVECTOR& aVector);

 SGVECTOR& operator=(const SGVECTOR& source);
};

The `IFSG_NODE` class is the base class for all scenegraph nodes. All
scenegraph objects implement the public functions of this class but in
some cases a particular function may have no meaning for a specific
class.

.ifsg_node.h
[source,c]

```

```

class IFSG_NODE
{
public:
 IFSG_NODE();
 virtual ~IFSG_NODE();

 /**
 * Function Destroy
 * deletes the scenegraph object held by this wrapper
 */
 void Destroy(void);

 /**
 * Function Attach
 * associates a given SGNODE* with this wrapper
 */
 virtual bool Attach(SGNODE* aNode) = 0;

 /**
 * Function NewNode
 * creates a new node to associate with this wrapper
 */
 virtual bool NewNode(SGNODE* aParent) = 0;
 virtual bool NewNode(IFSG_NODE& aParent) = 0;

 /**
 * Function GetRawPtr()
 * returns the raw internal SGNODE pointer
 */
 SGNODE* GetRawPtr(void);

 /**
 * Function GetNodeType
 * returns the type of this node instance
 */

```

```

S3D::SGTYPES GetNodeType(void) const;

/**
 * Function GetParent
 * returns a pointer to the parent SGNODE of this object
 * or NULL if the object has no parent (ie. top level transform)
 * or if the wrapper is not currently associated with an SGNODE.
 */
SGNODE* GetParent(void) const;

/**
 * Function SetParent
 * sets the parent SGNODE of this object.
 *
 * @param aParent [in] is the desired parent node
 * @return true if the operation succeeds; false if
 * the given node is not allowed to be a parent to
 * the derived object.
 */
bool SetParent(SGNODE* aParent);

/**
 * Function GetNodeTypeName
 * returns the text representation of the node type
 * or NULL if the node somehow has an invalid type
 */
const char * GetNodeTypeName(S3D::SGTYPES aNodeType) const;

/**
 * Function AddRefNode
 * adds a reference to an existing node which is not owned by
 * (not a child of) this node.
 *
 * @return true on success
 */

```

```

bool AddRefNode(SGNODE* aNode);

bool AddRefNode(IFSG_NODE& aNode);

/**
 * Function AddChildNode
 *
 * adds a node as a child owned by this node.
 *
 * @return true on success
 */

bool AddChildNode(SGNODE* aNode);

bool AddChildNode(IFSG_NODE& aNode);

};

```

`IFSG\_TRANSFORM` is similar to a VRML2.0 Transform node; it may contain any number of child IFSG\_SHAPE and IFSG\_TRANSFORM nodes and any number of referenced IFSG\_SHAPE and IFSG\_TRANSFORM nodes. A valid scenegraph must have a single `IFSG\_TRANSFORM` object as a root.

.ifsg\_transform.h

[source,c]

```

/**
 * Class IFSG_TRANSFORM
 *
 * is the wrapper for the VRML compatible TRANSFORM block class SCENEGRAPH
 */

class IFSG_TRANSFORM : public IFSG_NODE
{
public:

 IFSG_TRANSFORM(bool create);

 IFSG_TRANSFORM(SGNODE* aParent);
 bool SetScaleOrientation(const SGVECTOR& aScaleAxis, double aAngle);

```

```

 bool SetRotation(const SGVECTOR& aRotationAxis, double aAngle);

 bool SetScale(const SGPOINT& aScale);

 bool SetScale(double aScale);

 bool SetCenter(const SGPOINT& aCenter);

 bool SetTranslation(const SGPOINT& aTranslation);
/* various base class functions not shown here */

};

```

`IFSG\_SHAPE` is similar to a VRML2.0 Shape node; it must contain a single child or reference FACESET node and may contain a single child or reference APPEARANCE node.

```

.ifsg_shape.h
[source,c]

/**
 * Class IFSG_SHAPE
 * is the wrapper for the SGSHAPE class
 */

class IFSG_SHAPE : public IFSG_NODE
{
public:
 IFSG_SHAPE(bool create);
 IFSG_SHAPE(SGNODE* aParent);
 IFSG_SHAPE(IFSG_NODE& aParent);

 /* various base class functions not shown here */
};

```

`IFSG\_APPEARANCE` is similar to a VRML2.0 Appearance node, however,

at the moment it only represents the equivalent of an Appearance node containing a Material node.

```
.ifsg_appearance.h
[source,c]

class IFSG_APPEARANCE : public IFSG_NODE
{
public:
 IFSG_APPEARANCE(bool create);
 IFSG_APPEARANCE(SGNODE* aParent);
 IFSG_APPEARANCE(IFSG_NODE& aParent);

 bool SetEmissive(float aRVal, float aGVal, float aBVal);
 bool SetEmissive(const SGCOLOR* aRGBColor);
 bool SetEmissive(const SGCOLOR& aRGBColor);

 bool SetDiffuse(float aRVal, float aGVal, float aBVal);
 bool SetDiffuse(const SGCOLOR* aRGBColor);
 bool SetDiffuse(const SGCOLOR& aRGBColor);

 bool SetSpecular(float aRVal, float aGVal, float aBVal);
 bool SetSpecular(const SGCOLOR* aRGBColor);
 bool SetSpecular(const SGCOLOR& aRGBColor);

 bool SetAmbient(float aRVal, float aGVal, float aBVal);
 bool SetAmbient(const SGCOLOR* aRGBColor);
 bool SetAmbient(const SGCOLOR& aRGBColor);
 bool SetShininess(float aShininess);
 bool SetTransparency(float aTransparency);

 /* various base class functions not shown here */

 /* the following functions make no sense within an
 appearance node and always return a failure code
```

```

 bool AddRefNode(SGNODE* aNode);

 bool AddRefNode(IFSG_NODE& aNode);

 bool AddChildNode(SGNODE* aNode);

 bool AddChildNode(IFSG_NODE& aNode);

 */
};

```

`IFSG\_FACESET` is similar to a VRML2.0 Geometry node which contains an IndexedFaceSet node. It must contain a single child or reference COORDS node, a single child COORDINDEX node, and a single child or reference NORMALS node; in addition there may be a single child or reference COLORS node. A simplistic normals calculation function is provided to aid the user in assigning normal values to surfaces. The deviations from the VRML2.0 analogue are as follows:

- . Normals are always per-vertex.
- . Colors are always per vertex.
- . The coordinate index set must describe triangular faces only.

.ifsg\_faceset.h

[source,c]

-----

/\*\*

\* Class IFSG\_FACESET

\* is the wrapper for the SGFACESET class

\*/

class IFSG\_FACESET : public IFSG\_NODE

{

public:

IFSG\_FACESET( bool create );

IFSG\_FACESET( SGNODE\* aParent );

```

 IFSG_FACESET(IFSG_NODE& aParent);

 bool CalcNormals(SGNODE** aPtr);

 /* various base class functions not shown here */
};

.ifsg_coords.h
[source,c]

/**
 * Class IFSG_COORDS
 * is the wrapper for SGCORDS
 */
class IFSG_COORDS : public IFSG_NODE
{
public:
 IFSG_COORDS(bool create);
 IFSG_COORDS(SGNODE* aParent);
 IFSG_COORDS(IFSG_NODE& aParent);

 bool GetCoordsList(size_t& aListSize, SGPOINT*& aCoordsList);
 bool SetCoordsList(size_t aListSize, const SGPOINT* aCoordsList);
 bool AddCoord(double aXValue, double aYValue, double aZValue);
 bool AddCoord(const SGPOINT& aPoint);

 /* various base class functions not shown here */

 /* the following functions make no sense within a
 coords node and always return a failure code

 bool AddRefNode(SGNODE* aNode);
 bool AddRefNode(IFSG_NODE& aNode);

```

```

 bool AddChildNode(SGNODE* aNode);
 bool AddChildNode(IFSG_NODE& aNode);
 */
};

```

`IFSG\_COORDINDEX` is similar to a VRML2.0 coordIdx[] set except it must exclusively describe triangular faces, which implies that the total number of indices is divisible by 3.

.ifsg\_coordindex.h

[source,c]

-----

/\*\*

\* Class IFSG\_COORDINDEX

\* is the wrapper for SGCOORDINDEX

\*/

```

class IFSG_COORDINDEX : public IFSG_INDEX

```

```

{

```

```

public:

```

```

 IFSG_COORDINDEX(bool create);

```

```

 IFSG_COORDINDEX(SGNODE* aParent);

```

```

 IFSG_COORDINDEX(IFSG_NODE& aParent);

```

```

 bool GetIndices(size_t& nIndices, int*& aIndexList);

```

```

 bool SetIndices(size_t nIndices, int* aIndexList);

```

```

 bool AddIndex(int aIndex);

```

```

 /* various base class functions not shown here */

```

```

 /* the following functions make no sense within a
 coordindex node and always return a failure code

```

```

 bool AddRefNode(SGNODE* aNode);

 bool AddRefNode(IFSG_NODE& aNode);

 bool AddChildNode(SGNODE* aNode);

 bool AddChildNode(IFSG_NODE& aNode);

 */
};

```

`IFSG\_NORMALS` is equivalent to a VRML2.0 Normals node.

.ifsg\_normals.h

[source,c]

```

/**
 * Class IFSG_NORMALS
 * is the wrapper for the SGNORMALS class
 */

class IFSG_NORMALS : public IFSG_NODE
{
public:
 IFSG_NORMALS(bool create);

 IFSG_NORMALS(SGNODE* aParent);

 IFSG_NORMALS(IFSG_NODE& aParent);

 bool GetNormalList(size_t& aListSize, SGVECTOR*& aNormalList);

 bool SetNormalList(size_t aListSize, const SGVECTOR* aNormalList);

 bool AddNormal(double aXValue, double aYValue, double aZValue);

 bool AddNormal(const SGVECTOR& aNormal);

 /* various base class functions not shown here */

 /* the following functions make no sense within a
 normals node and always return a failure code
 */

```

```

 bool AddRefNode(SGNODE* aNode);

 bool AddRefNode(IFSG_NODE& aNode);

 bool AddChildNode(SGNODE* aNode);

 bool AddChildNode(IFSG_NODE& aNode);

 */
};

```

`IFSG\_COLORS` is similar to a VRML2.0 colors[] set.

.ifsg\_colors.h

[source,c]

-----

/\*\*

\* Class IFSG\_COLORS

\* is the wrapper for SGCOLORS

\*/

class IFSG\_COLORS : public IFSG\_NODE

{

public:

IFSG\_COLORS( bool create );

IFSG\_COLORS( SGNODE\* aParent );

IFSG\_COLORS( IFSG\_NODE& aParent );

bool GetColorList( size\_t& aListSize, SGCOLOR\*& aColorList );

bool SetColorList( size\_t aListSize, const SGCOLOR\* aColorList );

bool AddColor( double aRedValue, double aGreenValue, double aBlueValue );

bool AddColor( const SGCOLOR& aColor );

/\* various base class functions not shown here \*/

/\* the following functions make no sense within a

normals node and always return a failure code

```

 bool AddRefNode(IFSG_NODE& aNode);

 bool AddChildNode(SGNODE* aNode);

 bool AddChildNode(IFSG_NODE& aNode);

 */
};

```

The remaining API functions are defined in `ifsg\_api.h` as follows:

```

.ifsg_api.h
[source,c]

namespace S3D
{
 /**
 * Function GetLibVersion retrieves version information of the
 * kicad_3dsg library
 */
 SGLIB_API void GetLibVersion(unsigned char* Major, unsigned char* Minor,
 unsigned char* Patch, unsigned char* Revision);

 // functions to extract information from SGNODE pointers
 SGLIB_API S3D::SGTYPES GetSGNodeType(SGNODE* aNode);
 SGLIB_API SGNODE* GetSGNodeParent(SGNODE* aNode);
 SGLIB_API bool AddSGNodeRef(SGNODE* aParent, SGNODE* aChild);
 SGLIB_API bool AddSGNodeChild(SGNODE* aParent, SGNODE* aChild);
 SGLIB_API void AssociateSGNodeWrapper(SGNODE* aObject, SGNODE** aRefPtr);

 /**
 * Function CalcTriNorm
 * returns the normal vector of a triangle described by vertices p1, p2, p3
 */
 SGLIB_API SGVECTOR CalcTriNorm(const SGPOINT& p1, const SGPOINT& p2, const SGPOINT& p3);
 /**

```

```

* Function WriteCache

* writes the SGNODE tree to a binary cache file
*
* @param aFileName is the name of the file to write
* @param overwrite must be set to true to overwrite an existing file
* @param aNode is any node within the node tree which is to be written
* @return true on success
*/

SGLIB_API bool WriteCache(const char* aFileName, bool overwrite, SGNODE* aNode,
 const char* aPluginInfo);

/**
* Function ReadCache
* reads a binary cache file and creates an SGNODE tree
*
* @param aFileName is the name of the binary cache file to be read
* @return NULL on failure, on success a pointer to the top level SCENEGRAPH node;
* if desired this node can be associated with an IFSG_TRANSFORM wrapper via
* the IFSG_TRANSFORM::Attach() function.
*/

SGLIB_API SGNODE* ReadCache(const char* aFileName, void* aPluginMgr,
 bool (*aTagCheck)(const char*, void*));

/**
* Function WriteVRML
* writes out the given node and its subnodes to a VRML2 file
*
* @param filename is the name of the output file
* @param overwrite should be set to true to overwrite an existing VRML file
* @param aTopNode is a pointer to a SCENEGRAPH object representing the VRML scene
* @param reuse should be set to true to make use of VRML DEF/USE features
* @return true on success
*/

SGLIB_API bool WriteVRML(const char* filename, bool overwrite, SGNODE* aTopNode,
 bool reuse, bool renameNodes);

```

```

// NOTE: The following functions are used in combination to create a VRML
// assembly which may use various instances of each SG* representation of a module.
// A typical use case would be:
// 1. invoke 'ResetNodeIndex()' to reset the global node name indices
// 2. for each model pointer provided by 'S3DCACHE->Load()', invoke 'RenameNodes()' once;
// this ensures that all nodes have a unique name to present to the final output file.
// Internally, RenameNodes() will only rename the given node and all Child subnodes;
// nodes which are only referenced will not be renamed. Using the pointer supplied
// by 'S3DCACHE->Load()' ensures that all nodes but the returned node (top node) are
// children of at least one node, so all nodes are given unique names.
// 3. if SG* trees are created independently of S3DCACHE->Load() the user must invoke
// RenameNodes() as appropriate to ensure that all nodes have a unique name
// 4. create an assembly structure by creating new IFSG_TRANSFORM nodes as appropriate
// for each instance of a component; the component base model as returned by
// S3DCACHE->Load() may be added to these IFSG_TRANSFORM nodes via 'AddRefNode()';
// set the offset, rotation, etc of the IFSG_TRANSFORM node to ensure correct
// 5. Ensure that all new IFSG_TRANSFORM nodes are placed as child nodes within a
// top level IFSG_TRANSFORM node in preparation for final node naming and output
// 6. Invoke RenameNodes() on the top level assembly node
// 7. Invoke WriteVRML() as normal, with renameNodes = false, to write the entire assembly
// structure to a single VRML file
// 8. Clean up by deleting any extra IFSG_TRANSFORM wrappers and their underlying SG*
// classes which have been created solely for the assembly output

```

```

/**

```

```

 * Function ResetNodeIndex
 *
 * resets the global SG* class indices
 *
 * @param aNode may be any valid SGNODE
 */

```

```

SGLIB_API void ResetNodeIndex(SGNODE* aNode);

```

```

/**

```

```

 * Function RenameNodes
 *
 * renames a node and all children nodes based on the current

```

```

 * values of the global SG* class indices
 *
 * @param aNode is a top level node

title: Plugins Framework

weight: 19

---

The KiCad plugin system is a framework for extending the capabilities of KiCad using shared libraries. One of the main advantages of using a plugin is that it is not necessary to rebuild the KiCad suite while developing a plugin; in fact, plugins can be built with the aid of a very small set of headers from the KiCad source tree. Removing the requirement to build KiCad during plugin development greatly increases productivity by ensuring that the developer only compiles code directly related to the plugin which is being developed and thus reducing the time required for each build and test cycle.

Plugins were initially developed for the 3D model viewer to make it possible to support more types of 3D models without requiring major changes to the KiCad source for each new model type supported. The plugin framework was later generalized so that in the future developers can create different classes of plugins. Currently only 3D plugins are implemented within KiCad but it is envisioned that a PCB plugin will eventually be developed to make it possible for users to implement data Importers and Exporters.

[[plugin-classes]]

== Plugin Classes

Plugins are divided into Plugin Classes since each plugin addresses problems in a specific domain and therefore requires an interface unique to that domain. For example, the 3D model plugins load 3D model data from files and translate that data into a format which

can be displayed by the 3D viewer. A PCB Import/Export plugin would take PCB data and export to other electrical or mechanical data formats, or translate a foreign format into a KiCad PCB. At the moment only the 3D Plugin Class has been developed and it will be the focus of this document.

Implementing a Plugin Class requires creating code within the KiCad source tree which manages the loading of plugin code. Within the KiCad source tree, the file ``plugins/ldr/pluginldr.h`` declares the base class for all plugin loaders. This class declares the most basic functions which we would expect to find in any KiCad plugin (boilerplate code) and its implementation provides basic checks on version compatibility between the plugin loader and the available plugins. The header ``plugins/ldr/3d/pluginldr3D.h`` declares a loader for the 3D Plugin Class. The loader is responsible for loading a given plugin and making its functions available to KiCad. Each instance of a plugin loader represents an actual plugin implementation and acts as a transparent bridge between KiCad and the plugin's features. The loader is not the only code required within KiCad to support plugins: we also need code to discover the plugins and code to invoke the functions of the plugins via the plugin loader. In the case of the 3D plugins the discovery and invocation functions are all contained within the `S3D_CACHE` class.

Plugin developers do not need to be concerned with the details of KiCad's internal code for managing plugins unless a new Plugin Class is being developed; a plugin only needs to define the functions declared by their specific plugin class. The header ``include/plugins/kicad_plugin.h`` declares the generic functions required of all KiCad plugins; these functions identify the Plugin Class, provide the name of the specific plugin, provide version information for the Plugin Class API, provide version information for the specific plugin, and provide a basic version compatibility check on the Plugin Class API. In brief, these functions are:

[source,c]

-----

/\* Return a UTF-8 string naming the Plugin Class \*/

char const\* GetKicadPluginClass( void );

/\* Return version information for the Plugin Class API \*/

void GetClassVersion( unsigned char\* Major, unsigned char\* Minor,  
                    unsigned char\* Patch, unsigned char\* Revision );

/\*

Return true if the version check implemented in the plugin  
determines that the given Plugin Class API is compatible.

\*/

bool CheckClassVersion( unsigned char Major,  
                        unsigned char Minor, unsigned char Patch, unsigned char Revision );

/\* Return the name of the specific plugin, for example "PLUGIN\_3D\_VRML" \*/

const char\* GetKicadPluginName( void );

/\* Return version information for the specific plugin \*/

void GetPluginVersion( unsigned char\* Major, unsigned char\* Minor,  
                        unsigned char\* Patch, unsigned char\* Revision );

-----

[[class-plugin-3d]]

=== Plugin Class: PLUGIN\_3D

The header ``include/plugins/3d/3d_plugin.h`` declares the functions  
which must be implemented by all 3D plugins and defines a number of  
functions which are required by the plugin and which the user must  
not reimplement. The defined functions which the user must not

reimplement are:

[source,c]

-----

```

/* Returns the Plugin Class name "PLUGIN_3D" */
char const* GetKicadPluginClass(void);

/* Return version information for the PLUGIN_3D API */
void GetClassVersion(unsigned char* Major, unsigned char* Minor,
 unsigned char* Patch, unsigned char* Revision);

/*
 Performs basic version checks enforced by the developers of
 the loader for the PLUGIN_3D class and returns true if the
 checks pass
*/
bool CheckClassVersion(unsigned char Major, unsigned char Minor,
 unsigned char Patch, unsigned char Revision);

The functions which the user must implement are as follows:
[source,c]

/* Return the number of extension strings supported by the plugin */
int GetNExtensions(void);

/*
 Return the requested extension string; valid values are 0 to
 GetNExtensions() - 1
*/
char const* GetModelExtension(int aIndex);

/* Return the total number of file filters supported by the plugin */
int GetNFilters(void);

/*
 Return the file filter requested; valid values are 0 to
 GetNFilters() - 1
*/
char const* GetFileFilter(int aIndex);

```

```

/*
 Return true if the plugin can render this type of 3D model.

 In some cases a plugin may not yet provide a visual model
 and must return false.

*/
bool CanRender(void);

/* Load the specified model and return a pointer to its visual model data */
SCENEGRAPH* Load(char const* aFileName);

```

## == Tutorials: 3D Plugin Class

This section contains a description of two very simple plugins of the `PLUGIN_3D` class and walks the user through the setup and building of the code.

### [[basic-3d-plugin]]

#### === Basic 3D Plugin

This tutorial walks the user through the development of a very basic 3D plugin named "PLUGIN\_3D\_DEM01". The purpose of this tutorial is only to demonstrate the construction of a very basic 3D plugin which does nothing other than provide a few filter strings which permit the KiCad user to filter file names while browsing for 3D models. The code demonstrated here is the absolute minimum requirement for any 3D plugin and can be used as a template for creating more advanced plugins.

In order to build the demo project we require the following:

- \* <https://cmake.org/>[CMake]
- \* KiCad plugin headers

\* KiCad Scene Graph library `kicad\_3dsg`

To automatically detect the KiCad headers and library we shall use a CMake FindPackage script; the script supplied in this tutorial should work on Linux and Windows if the relevant header files are installed to `\${KICAD\_ROOT\_DIR}/kicad` and the KiCad Scene Graph library is installed in `\${KICAD\_ROOT\_DIR}/lib`.

To start let's create a project directory and the FindPackage script:

```
[source,bash]

mkdir demo && cd demo
export DEMO_ROOT=${PWD}
mkdir CMakeModules && cd CMakeModules
cat > FindKICAD.cmake << _EOF
find_path(KICAD_INCLUDE_DIR kicad/plugins/kicad_plugin.h
 PATHS ${KICAD_ROOT_DIR}/include $ENV{KICAD_ROOT_DIR}/include
 DOC "Kicad plugins header path."
)

if(NOT ${KICAD_INCLUDE_DIR} STREQUAL "KICAD_INCLUDE_DIR-NOTFOUND")

 # attempt to extract the version information from sg_version.h
 find_file(KICAD_SGVERSION sg_version.h
 PATHS ${KICAD_INCLUDE_DIR}
 PATH_SUFFIXES kicad/plugins/3dapi
 NO_DEFAULT_PATH)

 if(NOT ${KICAD_SGVERSION} STREQUAL "KICAD_SGVERSION-NOTFOUND")

 # extract the "#define KICADSG_VERSION*" lines
 file(STRINGS ${KICAD_SGVERSION} _version REGEX "^#define.*KICADSG_VERSION.*")

 foreach(SVAR ${_version})
```

```

 string(REGEX MATCH KICADSG_VERSION_[M,A,J,O,R,I,N,P,T,C,H,E,V,I,S]* _VARNAME ${SVAR})
 string(REGEX MATCH [0-9]+ _VALUE ${SVAR})

 if(NOT ${_VARNAME} STREQUAL "" AND NOT ${_VALUE} STREQUAL "")
 set($_${_VARNAME} ${_VALUE})
 endif()

 endforeach()

 #ensure that NOT SG3D_VERSION* will evaluate to '0'
 if(NOT _KICADSG_VERSION_MAJOR)
 set(_KICADSG_VERSION_MAJOR 0)
 endif()

 if(NOT _KICADSG_VERSION_MINOR)
 set(_KICADSG_VERSION_MINOR 0)
 endif()

 if(NOT _KICADSG_VERSION_PATCH)
 set(_KICADSG_VERSION_PATCH 0)
 endif()

 if(NOT _KICADSG_VERSION_REVISION)
 set(_KICADSG_VERSION_REVISION 0)
 endif()

 set(KICAD_VERSION ${_KICADSG_VERSION_MAJOR}.${_KICADSG_VERSION_MINOR}.${_KICADSG_VERSION_PATCH}.
unset(KICAD_SGVERSION CACHE)
endif()
endif()

find_library(KICAD_LIBRARY

 NAMES kicad_3dsg

 PATHS

```

```

 ${KICAD_ROOT_DIR}/lib $ENV{KICAD_ROOT_DIR}/lib

 ${KICAD_ROOT_DIR}/bin $ENV{KICAD_ROOT_DIR}/bin

DOC "Kicad scenegraph library path."

)

include(FindPackageHandleStandardArgs)

FIND_PACKAGE_HANDLE_STANDARD_ARGS(KICAD

 REQUIRED_VARS

 KICAD_INCLUDE_DIR

 KICAD_LIBRARY

 KICAD_VERSION

 VERSION_VAR KICAD_VERSION)

mark_as_advanced(KICAD_INCLUDE_DIR)

set(KICAD_VERSION_MAJOR ${_KICADSG_VERSION_MAJOR} CACHE INTERNAL "")
set(KICAD_VERSION_MINOR ${_KICADSG_VERSION_MINOR} CACHE INTERNAL "")
set(KICAD_VERSION_PATCH ${_KICADSG_VERSION_PATCH} CACHE INTERNAL "")
set(KICAD_VERSION_TWEAK ${_KICADSG_VERSION_REVISION} CACHE INTERNAL "")

_EOF

```

Kicad and its plugin headers must be installed; if they are installed to a user directory or under `/opt` on Linux, or you are using Windows, you will need to set the `KICAD\_ROOT\_DIR` environment variable to point to the directory containing the KiCad `include` and `lib` directories. For OS X the FindPackage script presented here may require some adjustments.

To configure and build the tutorial code we will use CMake and create a `CMakeLists.txt` script file:

```

[source,bash]

```

```

cd ${DEMO_ROOT}

cat > CMakeLists.txt << _EOF

declare the name of the project

project(PLUGIN_DEMO)

check that we have a version of CMake with all required features

cmake_minimum_required(VERSION 2.8.12 FATAL_ERROR)

inform CMake of where to find the FindKICAD script

set(CMAKE_MODULE_PATH ${PROJECT_SOURCE_DIR}/CMakeModules)

attempt to discover the installed kicad headers and library

and set the variables:

KICAD_INCLUDE_DIR

KICAD_LIBRARY

find_package(KICAD 1.0 REQUIRED)

add the kicad include directory to the compiler's search path

include_directories(${KICAD_INCLUDE_DIR}/kicad)

create a plugin named s3d_plugin_demo1

add_library(s3d_plugin_demo1 MODULE

 src/s3d_plugin_demo1.cpp

)

```

\_EOF

-----

The first demo project is very basic; it consists of a single file with no external link dependencies other than the compiler defaults. We start by creating a source directory:

[source,bash]

-----

```
cd ${DEMO_ROOT}
```

```
mkdir src && cd src
export DEMO_SRC=${PWD}

```

Now we create the plugin source itself:

```
.s3d_plugin_demo1.cpp
[source,c]

#include <iostream>

// the 3d_plugin.h header defines the functions required of 3D plugins
#include "plugins/3d/3d_plugin.h"

// define the version information of this plugin; do not confuse this
// with the Plugin Class version which is defined in 3d_plugin.h
#define PLUGIN_3D_DEM01_MAJOR 1
#define PLUGIN_3D_DEM01_MINOR 0
#define PLUGIN_3D_DEM01_PATCH 0
#define PLUGIN_3D_DEM01_REVNO 0

// implement the function which provides users with this plugin's name
const char* GetKicadPluginName(void)
{
 return "PLUGIN_3D_DEM01";
}

// implement the function which provides users with this plugin's version
void GetPluginVersion(unsigned char* Major, unsigned char* Minor,
 unsigned char* Patch, unsigned char* Revision)
{
 if(Major)
 *Major = PLUGIN_3D_DEM01_MAJOR;
 if(Minor)
 *Minor = PLUGIN_3D_DEM01_MINOR;
```

```

 if(Patch)

 *Patch = PLUGIN_3D_DEM01_PATCH;

 if(Revision)

 *Revision = PLUGIN_3D_DEM01_REVNO;
return;
}

// number of extensions supported; on *NIX systems the extensions are
// provided twice - once in lower case and once in upper case letters
#ifdef _WIN32

 #define NEXTS 7

#else

 #define NEXTS 14

#endif

// number of filter sets supported

#define NFILS 5

// define the extension strings and filter strings which this
// plugin will supply to the user
static char ext0[] = "wrl";
static char ext1[] = "x3d";
static char ext2[] = "emn";
static char ext3[] = "iges";
static char ext4[] = "igs";
static char ext5[] = "stp";
static char ext6[] = "step";

#ifdef _WIN32

static char fil0[] = "VRML 1.0/2.0 (*.wrl)|*.wrl";
static char fil1[] = "X3D (*.x3d)|*.x3d";
static char fil2[] = "IDF 2.0/3.0 (*.emn)|*.emn";
static char fil3[] = "IGESv5.3 (*.igs;*.iges)|*.igs;*.iges";
static char fil4[] = "STEP (*.stp;*.step)|*.stp;*.step";

```

```

#else

static char fil4[] = "STEP (*.stp;*.step;*.STP;*.STEP)|*.stp;*.step;*.STP;*.STEP";

#endif

// instantiate a convenient data structure for accessing the
// lists of extension and filter strings
static struct FILE_DATA
{
 char const* extensions[NEXTS];
 char const* filters[NFILS];

 FILE_DATA()
 {
 extensions[0] = ext0;
 extensions[1] = ext1;
 extensions[2] = ext2;
 extensions[3] = ext3;
 extensions[4] = ext4;
 extensions[5] = ext5;
 extensions[6] = ext6;
 filters[0] = fil0;
 filters[1] = fil1;
 filters[2] = fil2;
 }
};

```

```

 filters[3] = fil3;

 filters[4] = fil4;

#ifdef _WIN32

 extensions[7] = ext7;

 extensions[8] = ext8;

 extensions[9] = ext9;

 extensions[10] = ext10;

 extensions[11] = ext11;

 extensions[12] = ext12;

 extensions[13] = ext13;

#endif

 return;

 }

} file_data;

// return the number of extensions supported by this plugin
int GetNExtensions(void)
{
 return NEXTS;
}

// return the indexed extension string
char const* GetModelExtension(int aIndex)
{
 if(aIndex < 0 || aIndex >= NEXTS)
 return NULL;

 return file_data.extensions[aIndex];
}

// return the number of filter strings provided by this plugin
int GetNFilters(void)

```

```

{
 return NFILS;
}

// return the indexed filter string
char const* GetFileFilter(int aIndex)
{
 if(aIndex < 0 || aIndex >= NFILS)
 return NULL;

 return file_data.filters[aIndex];
}

// return false since this plugin does not provide visualization data
bool CanRender(void)
{
 return false;
}

// return NULL since this plugin does not provide visualization data
SCENEGRAPH* Load(char const* aFileName)
{
 // this dummy plugin does not support rendering of any models
 return NULL;
}

```

This source file meets all the minimum requirements to implement a 3D plugin. The plugin does not produce any data for rendering models but it can provide KiCad with a list of supported model file extensions and file extension filters to enhance the 3D model file selection dialog. Within KiCad the extension strings are used to select the plugins which may be used to load a specified model; for example, if the plugin is `wrl` then KiCad will invoke each plugin which claims to support the extension

`wrl` until a plugin returns visualization data. The file filters provided by each plugin are passed to the 3D file selector dialog to improve the browsing UI.

To build the plugin:

```
[source,bash]
```

```

```

```
cd ${DEMO_ROOT}
```

```
export KICAD_ROOT_DIR if necessary
```

```
mkdir build && cd build
```

```
cmake .. && make
```

```

```

The plugin will be built but not installed; you must copy the plugin file to KiCad's plugin directory if you wish to load the plugin.

```
[[advanced-3d-plugin]]
```

```
=== Advanced 3D Plugin
```

This tutorial walks the user through the development of a 3D plugin named "PLUGIN\_3D\_DEM02". The purpose of this tutorial is to demonstrate the construction of a very basic scene graph which the KiCad previewer can render. The plugin claims to handle files of type `txt`. Although the file must exist in order for the cache manager to invoke the plugin, the file contents are not processed by this plugin; instead, the plugin simply creates a scene graph containing a pair of tetrahedra. This tutorial assumes that the first tutorial had been completed and that the CMakeLists.txt and FindKICAD.cmake script files have been created.

Place the new source file in the same directory as the previous

tutorial's source file and we will extend the previous tutorial's CMakeLists.txt file to build this tutorial. Since this plugin will

create a scene graph for KiCad we need to link to KiCad's scene graph library `kicad\_3dsg`. KiCad's Scene Graph Library provides a set of classes which can be used to build the Scene Graph Object; the Scene Graph Object is an intermediate data visualization format used by the 3D Cache Manager. All plugins which support model visualization must translate the model data into a scene graph via this library.

The first step is to extend `CMakeLists.txt` to build this tutorial project:  
[source,bash]

```

cd ${DEMO_ROOT}

cat >> CMakeLists.txt << _EOF
add_library(s3d_plugin_demo2 MODULE
 src/s3d_plugin_demo2.cpp
)

target_link_libraries(s3d_plugin_demo2 ${KICAD_LIBRARY})
_EOF

```

Now we change to the source directory and create the source file:

```
[source,bash]

cd ${DEMO_SRC}

.s3d_plugin_demo2.cpp
[source,c]

#include <cmath>

// 3D Plugin Class declarations
#include "plugins/3d/3d_plugin.h"

// interface to KiCad Scene Graph Library
```

```

#include "plugins/3dapi/ifsg_all.h"

// version information for this plugin

#define PLUGIN_3D_DEM02_MAJOR 1
#define PLUGIN_3D_DEM02_MINOR 0
#define PLUGIN_3D_DEM02_PATCH 0
#define PLUGIN_3D_DEM02_REVNO 0

// provide the name of this plugin
const char* GetKicadPluginName(void)
{
 return "PLUGIN_3D_DEM02";
}

// provide the version of this plugin
void GetPluginVersion(unsigned char* Major, unsigned char* Minor,
 unsigned char* Patch, unsigned char* Revision)
{
 if(Major)
 *Major = PLUGIN_3D_DEM02_MAJOR;

 if(Minor)
 *Minor = PLUGIN_3D_DEM02_MINOR;

 if(Patch)
 *Patch = PLUGIN_3D_DEM02_PATCH;

 if(Revision)
 *Revision = PLUGIN_3D_DEM02_REVNO;

 return;
}
// number of extensions supported
#ifdef _WIN32
#define NEXTS 1

```

```

#else

#define NEXTS 2

#endif

// number of filter sets supported

#define NFILS 1

static char ext0[] = "txt";

#ifdef _WIN32

static char fil0[] = "demo (*.txt)|*.txt";

#else

 return true;
}

// create the visualization data
SCENEGRAPH* Load(char const* aFileName)

```

```

{
 // For this demonstration we create a tetrahedron (tx1) consisting
 // of a SCENEGRAPH (VRML Transform) which in turn contains 4
 // SGSHAPE (VRML Shape) objects representing each of the sides of
 // the tetrahedron. Each Shape is associated with a color (SGAPPEARANCE)
 // and a SGFACESET (VRML Geometry->indexedFaceSet). Each SGFACESET is
 // associated with a vertex list (SGCOORDS), a per-vertex normals
 // list (SGNORMALS), and a coordinate index (SGCOORDINDEX). One shape
 // is used to represent each face so that we may use per-vertex-per-face
 // normals.
 //
 // The tetrahedron in turn is a child of a top level SCENEGRAPH (tx0)
 // which has a second SCENEGRAPH child (tx2) which is a transformation
 // of the tetrahedron tx1 (rotation + translation). This demonstrates
 // the reuse of components within the scene graph hierarchy.

 // define the vertices of the tetrahedron
 // face 1: 0, 3, 1
 // face 2: 0, 2, 3
 // face 3: 1, 3, 2
 // face 4: 0, 1, 2
 double SQ2 = sqrt(0.5);
 SGPOINT vert[4];
 vert[0] = SGPOINT(1.0, 0.0, -SQ2);
 vert[1] = SGPOINT(-1.0, 0.0, -SQ2);
 vert[2] = SGPOINT(0.0, 1.0, SQ2);
 vert[3] = SGPOINT(0.0, -1.0, SQ2);

 // create the top level transform; this will hold all other
 // scenegraph objects; a transform may hold other transforms and
 // shapes
 IFSG_TRANSFORM* tx0 = new IFSG_TRANSFORM(true);
 // create the transform which will house the shapes
 IFSG_TRANSFORM* tx1 = new IFSG_TRANSFORM(tx0->GetRawPtr());

```

```

// add a shape which we will use to define one face of the tetrahedron;

// shapes hold facesets and appearances

IFSG_SHAPE* shape = new IFSG_SHAPE(*tx1);
// add a faceset; these contain coordinate lists, coordinate indices,

// vertex lists, vertex indices, and may also contain color lists and

// their indices.

IFSG_FACESET* face = new IFSG_FACESET(*shape);

IFSG_COORDS* cp = new IFSG_COORDS(*face);

cp->AddCoord(vert[0]);
cp->AddCoord(vert[3]);
cp->AddCoord(vert[1]);

// coordinate indices - note: enforce triangles;
// in real plugins where it is not necessarily possible
// to determine which side a triangle is visible from,
// 2 point orders must be specified for each triangle
IFSG_COORDINDEX* coordIdx = new IFSG_COORDINDEX(*face);
coordIdx->AddIndex(0);
coordIdx->AddIndex(1);
coordIdx->AddIndex(2);

// create an appearance; appearances are owned by shapes

// magenta
IFSG_APPEARANCE* material = new IFSG_APPEARANCE(*shape);
material->SetSpecular(0.1, 0.0, 0.1);
material->SetDiffuse(0.8, 0.0, 0.8);
material->SetAmbient(0.2, 0.2, 0.2);
material->SetShininess(0.2);

// normals
IFSG_NORMALS* np = new IFSG_NORMALS(*face);
SGVECTOR nval = S3D::CalcTriNorm(vert[0], vert[3], vert[1]);

```

```

```

## == Application Programming Interface (API)

Plugins are implemented via Application Programming Interface (API) implementations. Each Plugin Class has its specific API and in the 3D Plugin tutorials we have seen examples of the implementation of the 3D Plugin API as declared by the header ``3d_plugin.h``. Plugins may also rely on other APIs defined within the KiCad source tree; in the case of 3D plugins, all plugins which support visualization of models must interact with the Scene Graph API as declared in the header ``ifsg_all.h`` and its included headers.

This section describes the details of available Plugin Class APIs and other KiCad APIs which may be required for implementations of plugin classes.

## === Plugin Class APIs

There is currently only one plugin class declared for KiCad: the 3D Plugin Class. All KiCad plugin classes must implement

a basic set of functions declared in the header file ``kicad_plugin.h``; these declarations are referred to as the Base Kicad Plugin Class.

No implementation of the Base Kicad Plugin Class exists; the header file exists purely to ensure that plugin developers implement these defined functions in each plugin implementation. Within KiCad, each instance of a Plugin Loader implements the API presented by a plugin as though the Plugin Loader is a class providing the plugin's services. This is achieved by the Plugin Loader class providing a public interface containing function names which are similar to those implemented by the plugin; the argument lists may vary to accommodate the need to inform the user of any problems which may be encountered if, for example, no plugin is loaded. Internally the Plugin Loader uses a stored pointer to each API function to invoke each function on behalf of the user.

#### ==== API: Base Kicad Plugin Class

The Base Kicad Plugin Class is defined by the header file ``kicad_plugin.h``. This header must be included in the declaration of all other plugin classes; for an example see the 3D Plugin Class declaration in the header file ``3d_plugin.h``. The prototypes for these functions were briefly described in <<plugin-classes,Plugin Classes>>. The API is implemented by the base plugin loader as defined in ``pluginldr.cpp``.

To help make sense of the functions required by the base KiCad plugin header we must look at what happens in the base Plugin Loader class. The Plugin Loader class declares a virtual function ``Open()`` which takes the full path to the plugin to be loaded. The implementation of the ``Open()`` function within a specific plugin class loader will initially invoke the protected ``open()`` function of the base plugin loader; this base ``open()`` function attempts to find the address of each of the required basic plugin functions; once the addresses of each function have been retrieved, a number of checks are enforced:

- . Plugin ``GetKicadPluginClass()`` is invoked and the result is compared to the Plugin Class string provided by the Plugin Loader implementation; if

these strings do not match then the opened plugin is not intended for the Plugin Loader instance.

- . Plugin ``GetClassVersion()`` is invoked to retrieve the Plugin Class API Version implemented by the plugin.
- . Plugin Loader virtual ``GetLoaderVersion()`` function is invoked to retrieve the Plugin Class API Version implemented by the loader.
- . The Plugin Class API Version reported by the plugin and the loader are required to have the same Major Version number, otherwise they are considered incompatible. This is the most basic version test and it is enforced by the base plugin loader.
- . Plugin ``CheckClassVersion()`` is invoked with the Plugin Class API Version information of the Plugin Loader; if the Plugin supports the given version then it returns ``true`` to indicate success. If successful the loader creates a `PluginInfo` string based on the results of ``GetKicadPluginName()`` and ``GetPluginVersion()``, and the plugin loading procedure continues within the Plugin Loader's ``Open()`` implementation.

#### ==== API: 3D Plugin Class

The 3D Plugin Class is declared by the header file ``3d_plugin.h`` and it extends the required plugin functions as described in `<<class-plugin-3d,Plugin Class: PLUGIN_3D>>`. The corresponding Plugin Loader is defined in ``pluginldr3D.cpp`` and the loader implements the following public functions in addition to the required API functions:

[source,c]

-----

```
/* Open the plugin specified by the full path "aFullFileName" */
```

```
bool Open(const wxString& aFullFileName);
```

```
/* Close the currently opened plugin */
```

```
void Close(void);
```

```
/* Retrieve the Plugin Class API Version implemented by this Plugin Loader */
```

```
void GetLoaderVersion(unsigned char* Major, unsigned char* Minor,
 unsigned char* Revision, unsigned char* Patch) const;

```

The required 3D Plugin Class functions are exposed via the following functions:

```
[source,c]
```

```

```

```
/* returns the Plugin Class or NULL if no plugin loaded */
```

```
char const* GetKicadPluginClass(void);
```

```
/* returns false if no plugin loaded */
```

```
bool GetClassVersion(unsigned char* Major, unsigned char* Minor,
 unsigned char* Patch, unsigned char* Revision);
```

```
/* returns false if the class version check fails or no plugin is loaded */
```

```
bool CheckClassVersion(unsigned char Major, unsigned char Minor,
 unsigned char Patch, unsigned char Revision);
```

```
/* returns the Plugin Name or NULL if no plugin loaded */
```

```
const char* GetKicadPluginName(void);
```

```
/*
```

```
 returns false if no plugin is loaded, otherwise the arguments
 contain the result of GetPluginVersion()
```

```
*/
```

```
bool GetVersion(unsigned char* Major, unsigned char* Minor,
 unsigned char* Patch, unsigned char* Revision);
```

```
/*
```

```
 sets aPluginInfo to an empty string if no plugin is loaded,
 otherwise aPluginInfo is set to a string of the form:
```

```
[NAME]:[MAJOR].[MINOR].[PATCH].[REVISION] where
NAME = name provided by GetKicadPluginClass()
```

```

 MAJOR, MINOR, PATCH, REVISION = version information from
 GetPluginVersion()

*/

void GetPluginInfo(std::string& aPluginInfo);

```

In typical situations, the user would do the following:

- . Create an instance of `KICAD\_PLUGIN\_LDR\_3D`.
- . Invoke `Open( "/path/to/myplugin.so" )` to open a specific plugin.  
The return value must be checked to ensure that the plugin loaded as desired.
- . Invoke any of the 3D Plugin Class calls as exposed by `KICAD\_PLUGIN\_LDR\_3D`.
- . Invoke `Close()` to close (unlink) the plugin.
- . Destroy the `KICAD\_PLUGIN\_LDR\_3D` instance.

#### === Scenegraph Class APIs

The Scenegraph Class API is defined by the header `ifsg\_all.h` and its included headers. The API consists of a number of helper routines with the namespace `S3D` as defined in `ifsg\_api.h` and wrapper classes defined by the various `ifsg\_\*.h` headers; the wrappers support the underlying scene graph classes which, taken together, form a scene graph structure which is compatible with VRML2.0 static scene graphs. The headers, structures, classes and their public functions are as follows:

```

.sg_version.h

[source,c]

/*

 Defines version information of the SceneGraph Classes.

 All plugins which use the scenegraph class should include this header
 and check the version information against the version reported by
 S3D::GetLibVersion() to ensure compatibility

*/

#define KICADSG_VERSION_MAJOR 2
#define KICADSG_VERSION_MINOR 0

```

```
#define KICADSG_VERSION_PATCH 0
```

```
#define KICADSG_VERSION_REVISION 0
```

```

```

```
.sg_types.h
```

```
[source,c]
```

```

```

```
/*
```

```
 Defines the SceneGraph Class Types; these types
 are closely related to VRML2.0 node types.
```

```
*/
```

```
namespace S3D
```

```
{
```

```
 enum SGTYPES
```

```
 {
```

```
 SGTYPE_TRANSFORM = 0,
```

```
 SGTYPE_APPEARANCE,
```

```
 SGTYPE_COLORS,
```

```
 SGTYPE_COLORINDEX,
```

```
 SGTYPE_FACESET,
```

```
 SGTYPE_COORDS,
```

```
 SGTYPE_COORDINDEX,
```

```
 SGTYPE_NORMALS,
```

```
 SGTYPE_SHAPE,
```

```
 SGTYPE_END
```

```
 };
```

```
};
```

```

```

The `sg\_base.h` header contains declarations of basic data types used

by the scenegraph classes.

```
.sg_base.h
```

```
[source,c]
```

```

/*
 This is an RGB color model equivalent to the VRML2.0
 RGB model where each color may have a value within the

 range [0..1].

*/

class SGCOLOR
{
public:
 SGCOLOR();

 SGCOLOR(float aRVal, float aGVal, float aBVal);

 void GetColor(float& aRedVal, float& aGreenVal, float& aBlueVal) const;
 void GetColor(SGCOLOR& aColor) const;
 void GetColor(SGCOLOR* aColor) const;

 bool SetColor(float aRedVal, float aGreenVal, float aBlueVal);
 bool SetColor(const SGCOLOR& aColor);
 bool SetColor(const SGCOLOR* aColor);
};

class SGPOINT
{
public:
 double x;
 double y;
 double z;

public:
 SGPOINT();

 SGPOINT(double aXVal, double aYVal, double aZVal);

 void GetPoint(double& aXVal, double& aYVal, double& aZVal);

```

```

void GetPoint(SGPOINT& aPoint);

void GetPoint(SGPOINT* aPoint);

void SetPoint(double aXVal, double aYVal, double aZVal);

void SetPoint(const SGPOINT& aPoint);

};

/*
 A SGVECTOR has 3 components (x,y,z) similar to a point; however
 a vector ensures that the stored values are normalized and
 prevents direct manipulation of the component variables.
*/

class SGVECTOR
{
public:
 SGVECTOR();

 SGVECTOR(double aXVal, double aYVal, double aZVal);

 void GetVector(double& aXVal, double& aYVal, double& aZVal) const;

 void SetVector(double aXVal, double aYVal, double aZVal);

 void SetVector(const SGVECTOR& aVector);

 SGVECTOR& operator=(const SGVECTOR& source);

};

The `IFSG_NODE` class is the base class for all scenegraph nodes. All
scenegraph objects implement the public functions of this class but in
some cases a particular function may have no meaning for a specific
class.

.ifsg_node.h

[source,c]

```

```

class IFSG_NODE
{
public:
 IFSG_NODE();
 virtual ~IFSG_NODE();

 /**
 * Function Destroy
 * deletes the scenegraph object held by this wrapper
 */
 void Destroy(void);

 /**
 * Function Attach
 * associates a given SGNODE* with this wrapper
 */
 virtual bool Attach(SGNODE* aNode) = 0;

 /**
 * Function NewNode
 * creates a new node to associate with this wrapper
 */
 virtual bool NewNode(SGNODE* aParent) = 0;
 virtual bool NewNode(IFSG_NODE& aParent) = 0;

 /**
 * Function GetRawPtr()
 * returns the raw internal SGNODE pointer
 */
 SGNODE* GetRawPtr(void);

 /**
 * Function GetNodeType
 * returns the type of this node instance
 */

```

```

S3D::SGTYPES GetNodeType(void) const;

/**
 * Function GetParent
 * returns a pointer to the parent SGNODE of this object
 * or NULL if the object has no parent (ie. top level transform)
 * or if the wrapper is not currently associated with an SGNODE.
 */
SGNODE* GetParent(void) const;

/**
 * Function SetParent
 * sets the parent SGNODE of this object.
 *
 * @param aParent [in] is the desired parent node
 * @return true if the operation succeeds; false if
 * the given node is not allowed to be a parent to
 * the derived object.
 */
bool SetParent(SGNODE* aParent);

/**
 * Function GetNodeTypeName
 * returns the text representation of the node type
 * or NULL if the node somehow has an invalid type
 */
const char * GetNodeTypeName(S3D::SGTYPES aNodeType) const;

/**
 * Function AddRefNode
 * adds a reference to an existing node which is not owned by
 * (not a child of) this node.
 *
 * @return true on success
 */

```

```

 bool AddRefNode(SGNODE* aNode);

 bool AddRefNode(IFSG_NODE& aNode);

 /**
 * Function AddChildNode
 *
 * adds a node as a child owned by this node.
 *
 * @return true on success
 */

 bool AddChildNode(SGNODE* aNode);

 bool AddChildNode(IFSG_NODE& aNode);
};

```

`IFSG\_TRANSFORM` is similar to a VRML2.0 Transform node; it may contain any number of child IFSG\_SHAPE and IFSG\_TRANSFORM nodes and any number of referenced IFSG\_SHAPE and IFSG\_TRANSFORM nodes. A valid scenegraph must have a single `IFSG\_TRANSFORM` object as a root.

.ifsg\_transform.h

[source,c]

```

/**
 * Class IFSG_TRANSFORM
 *
 * is the wrapper for the VRML compatible TRANSFORM block class SCENEGRAPH
 */

class IFSG_TRANSFORM : public IFSG_NODE
{
public:

 IFSG_TRANSFORM(bool create);

 IFSG_TRANSFORM(SGNODE* aParent);
 bool SetScaleOrientation(const SGVECTOR& aScaleAxis, double aAngle);

```

```

 bool SetRotation(const SGVECTOR& aRotationAxis, double aAngle);

 bool SetScale(const SGPOINT& aScale);

 bool SetScale(double aScale);

 bool SetCenter(const SGPOINT& aCenter);

 bool SetTranslation(const SGPOINT& aTranslation);
/* various base class functions not shown here */

};

```

`IFSG\_SHAPE` is similar to a VRML2.0 Shape node; it must contain a single child or reference FACESET node and may contain a single child or reference APPEARANCE node.

```

.ifsg_shape.h
[source,c]

/**
 * Class IFSG_SHAPE
 * is the wrapper for the SGSHAPE class
 */

class IFSG_SHAPE : public IFSG_NODE
{
public:
 IFSG_SHAPE(bool create);
 IFSG_SHAPE(SGNODE* aParent);
 IFSG_SHAPE(IFSG_NODE& aParent);

 /* various base class functions not shown here */
};

```

`IFSG\_APPEARANCE` is similar to a VRML2.0 Appearance node, however,

at the moment it only represents the equivalent of an Appearance node containing a Material node.

```
.ifsg_appearance.h
[source,c]

class IFSG_APPEARANCE : public IFSG_NODE
{
public:
 IFSG_APPEARANCE(bool create);
 IFSG_APPEARANCE(SGNODE* aParent);
 IFSG_APPEARANCE(IFSG_NODE& aParent);

 bool SetEmissive(float aRVal, float aGVal, float aBVal);
 bool SetEmissive(const SGCOLOR* aRGBColor);
 bool SetEmissive(const SGCOLOR& aRGBColor);

 bool SetDiffuse(float aRVal, float aGVal, float aBVal);
 bool SetDiffuse(const SGCOLOR* aRGBColor);
 bool SetDiffuse(const SGCOLOR& aRGBColor);

 bool SetSpecular(float aRVal, float aGVal, float aBVal);
 bool SetSpecular(const SGCOLOR* aRGBColor);
 bool SetSpecular(const SGCOLOR& aRGBColor);

 bool SetAmbient(float aRVal, float aGVal, float aBVal);
 bool SetAmbient(const SGCOLOR* aRGBColor);
 bool SetAmbient(const SGCOLOR& aRGBColor);
 bool SetShininess(float aShininess);
 bool SetTransparency(float aTransparency);

 /* various base class functions not shown here */

 /* the following functions make no sense within an
 appearance node and always return a failure code
```

```

 bool AddRefNode(SGNODE* aNode);

 bool AddRefNode(IFSG_NODE& aNode);

 bool AddChildNode(SGNODE* aNode);

 bool AddChildNode(IFSG_NODE& aNode);

 */
};

```

`IFSG\_FACESET` is similar to a VRML2.0 Geometry node which contains an IndexedFaceSet node. It must contain a single child or reference COORDS node, a single child COORDINDEX node, and a single child or reference NORMALS node; in addition there may be a single child or reference COLORS node. A simplistic normals calculation function is provided to aid the user in assigning normal values to surfaces. The deviations from the VRML2.0 analogue are as follows:

- . Normals are always per-vertex.
- . Colors are always per vertex.
- . The coordinate index set must describe triangular faces only.

.ifsg\_faceset.h

[source,c]

-----

/\*\*

\* Class IFSG\_FACESET

\* is the wrapper for the SGFACESET class

\*/

class IFSG\_FACESET : public IFSG\_NODE

{

public:

IFSG\_FACESET( bool create );

IFSG\_FACESET( SGNODE\* aParent );

```

 IFSG_FACESET(IFSG_NODE& aParent);

 bool CalcNormals(SGNODE** aPtr);

 /* various base class functions not shown here */
};

.ifsg_coords.h
[source,c]

/**
 * Class IFSG_COORDS
 * is the wrapper for SGCORDS
 */
class IFSG_COORDS : public IFSG_NODE
{
public:
 IFSG_COORDS(bool create);
 IFSG_COORDS(SGNODE* aParent);
 IFSG_COORDS(IFSG_NODE& aParent);

 bool GetCoordsList(size_t& aListSize, SGPOINT*& aCoordsList);
 bool SetCoordsList(size_t aListSize, const SGPOINT* aCoordsList);
 bool AddCoord(double aXValue, double aYValue, double aZValue);
 bool AddCoord(const SGPOINT& aPoint);

 /* various base class functions not shown here */

 /* the following functions make no sense within a
 coords node and always return a failure code

 bool AddRefNode(SGNODE* aNode);
 bool AddRefNode(IFSG_NODE& aNode);

```

```

 bool AddChildNode(SGNODE* aNode);
 bool AddChildNode(IFSG_NODE& aNode);
 */
};

```

`IFSG\_COORDINDEX` is similar to a VRML2.0 coordIdx[] set except it must exclusively describe triangular faces, which implies that the total number of indices is divisible by 3.

.ifsg\_coordindex.h

[source,c]

-----

/\*\*

\* Class IFSG\_COORDINDEX

\* is the wrapper for SGCOORDINDEX

\*/

```

class IFSG_COORDINDEX : public IFSG_INDEX

```

```

{

```

```

public:

```

```

 IFSG_COORDINDEX(bool create);

```

```

 IFSG_COORDINDEX(SGNODE* aParent);

```

```

 IFSG_COORDINDEX(IFSG_NODE& aParent);

```

```

 bool GetIndices(size_t& nIndices, int*& aIndexList);

```

```

 bool SetIndices(size_t nIndices, int* aIndexList);

```

```

 bool AddIndex(int aIndex);

```

```

 /* various base class functions not shown here */

```

```

 /* the following functions make no sense within a
 coordindex node and always return a failure code

```

```

 bool AddRefNode(SGNODE* aNode);

 bool AddRefNode(IFSG_NODE& aNode);

 bool AddChildNode(SGNODE* aNode);

 bool AddChildNode(IFSG_NODE& aNode);

 */
};

```

`IFSG\_NORMALS` is equivalent to a VRML2.0 Normals node.

.ifsg\_normals.h

[source,c]

```

/**
 * Class IFSG_NORMALS
 * is the wrapper for the SGNORMALS class
 */

class IFSG_NORMALS : public IFSG_NODE
{
public:
 IFSG_NORMALS(bool create);

 IFSG_NORMALS(SGNODE* aParent);

 IFSG_NORMALS(IFSG_NODE& aParent);

 bool GetNormalList(size_t& aListSize, SGVECTOR*& aNormalList);

 bool SetNormalList(size_t aListSize, const SGVECTOR* aNormalList);

 bool AddNormal(double aXValue, double aYValue, double aZValue);

 bool AddNormal(const SGVECTOR& aNormal);

 /* various base class functions not shown here */

 /* the following functions make no sense within a
 normals node and always return a failure code
 */

```

```

 bool AddRefNode(SGNODE* aNode);

 bool AddRefNode(IFSG_NODE& aNode);

 bool AddChildNode(SGNODE* aNode);

 bool AddChildNode(IFSG_NODE& aNode);

 */
};

```

`IFSG\_COLORS` is similar to a VRML2.0 colors[] set.

.ifsg\_colors.h

[source,c]

-----

/\*\*

\* Class IFSG\_COLORS

\* is the wrapper for SGCOLORS

\*/

class IFSG\_COLORS : public IFSG\_NODE

{

public:

IFSG\_COLORS( bool create );

IFSG\_COLORS( SGNODE\* aParent );

IFSG\_COLORS( IFSG\_NODE& aParent );

bool GetColorList( size\_t& aListSize, SGCOLOR\*& aColorList );

bool SetColorList( size\_t aListSize, const SGCOLOR\* aColorList );

bool AddColor( double aRedValue, double aGreenValue, double aBlueValue );

bool AddColor( const SGCOLOR& aColor );

/\* various base class functions not shown here \*/

/\* the following functions make no sense within a

normals node and always return a failure code

bool AddRefNode( SGNODE\* aNode );

```

 bool AddRefNode(IFSG_NODE& aNode);

 bool AddChildNode(SGNODE* aNode);

 bool AddChildNode(IFSG_NODE& aNode);

 */
};

```

The remaining API functions are defined in `ifsg\_api.h` as follows:

```

.ifsg_api.h
[source,c]

namespace S3D
{

 /**
 * Function GetLibVersion retrieves version information of the
 * kicad_3dsg library
 */
 SGLIB_API void GetLibVersion(unsigned char* Major, unsigned char* Minor,
 unsigned char* Patch, unsigned char* Revision);

 // functions to extract information from SGNODE pointers
 SGLIB_API S3D::SGTYPES GetSGNodeType(SGNODE* aNode);
 SGLIB_API SGNODE* GetSGNodeParent(SGNODE* aNode);
 SGLIB_API bool AddSGNodeRef(SGNODE* aParent, SGNODE* aChild);
 SGLIB_API bool AddSGNodeChild(SGNODE* aParent, SGNODE* aChild);
 SGLIB_API void AssociateSGNodeWrapper(SGNODE* aObject, SGNODE** aRefPtr);

 /**
 * Function CalcTriNorm
 * returns the normal vector of a triangle described by vertices p1, p2, p3
 */
 SGLIB_API SGVECTOR CalcTriNorm(const SGPOINT& p1, const SGPOINT& p2, const SGPOINT& p3);
 /**

```

```

* Function WriteCache

* writes the SGNODE tree to a binary cache file
*
* @param aFileName is the name of the file to write
* @param overwrite must be set to true to overwrite an existing file
* @param aNode is any node within the node tree which is to be written
* @return true on success
*/

SGLIB_API bool WriteCache(const char* aFileName, bool overwrite, SGNODE* aNode,
 const char* aPluginInfo);

/**
* Function ReadCache
* reads a binary cache file and creates an SGNODE tree
*
* @param aFileName is the name of the binary cache file to be read
* @return NULL on failure, on success a pointer to the top level SCENEGRAPH node;
* if desired this node can be associated with an IFSG_TRANSFORM wrapper via
* the IFSG_TRANSFORM::Attach() function.
*/

SGLIB_API SGNODE* ReadCache(const char* aFileName, void* aPluginMgr,
 bool (*aTagCheck)(const char*, void*));

/**
* Function WriteVRML
* writes out the given node and its subnodes to a VRML2 file
*
* @param filename is the name of the output file
* @param overwrite should be set to true to overwrite an existing VRML file
* @param aTopNode is a pointer to a SCENEGRAPH object representing the VRML scene
* @param reuse should be set to true to make use of VRML DEF/USE features
* @return true on success
*/

SGLIB_API bool WriteVRML(const char* filename, bool overwrite, SGNODE* aTopNode,
 bool reuse, bool renameNodes);

```

```

// NOTE: The following functions are used in combination to create a VRML
// assembly which may use various instances of each SG* representation of a module.
// A typical use case would be:
// 1. invoke 'ResetNodeIndex()' to reset the global node name indices
// 2. for each model pointer provided by 'S3DCACHE->Load()', invoke 'RenameNodes()' once;
// this ensures that all nodes have a unique name to present to the final output file.
// Internally, RenameNodes() will only rename the given node and all Child subnodes;
// nodes which are only referenced will not be renamed. Using the pointer supplied
// by 'S3DCACHE->Load()' ensures that all nodes but the returned node (top node) are
// children of at least one node, so all nodes are given unique names.
// 3. if SG* trees are created independently of S3DCACHE->Load() the user must invoke
// RenameNodes() as appropriate to ensure that all nodes have a unique name
// 4. create an assembly structure by creating new IFSG_TRANSFORM nodes as appropriate
// for each instance of a component; the component base model as returned by
// S3DCACHE->Load() may be added to these IFSG_TRANSFORM nodes via 'AddRefNode()';
// set the offset, rotation, etc of the IFSG_TRANSFORM node to ensure correct
// 5. Ensure that all new IFSG_TRANSFORM nodes are placed as child nodes within a
// top level IFSG_TRANSFORM node in preparation for final node naming and output
// 6. Invoke RenameNodes() on the top level assembly node
// 7. Invoke WriteVRML() as normal, with renameNodes = false, to write the entire assembly
// structure to a single VRML file
// 8. Clean up by deleting any extra IFSG_TRANSFORM wrappers and their underlying SG*
// classes which have been created solely for the assembly output

The settings framework manages application settings, as well as projects. This document explains how to make use of the framework as well as some of its inner workings.

== Source Code Guide

Most of the relevant code is in `common/settings` and `common/project`.

[cols=2\*,options="header"]

|===

| {cpp} Class              | Description                                                                |
|--------------------------|----------------------------------------------------------------------------|
| `SETTINGS_MANAGER`       | Loads and unloads settings files and projects                              |
| `JSON_SETTINGS`          | The base class for all settings objects. Represents a single JSON file.    |
| `NESTED_SETTINGS`        | A `JSON_SETTINGS` object stored within another (i.e. without its own file) |
| `PARAM`                  | A parameter: helper class for storing data inside a `JSON_SETTINGS`        |
| `APP_SETTINGS_BASE`      | Base class for application (frame) settings                                |
| `COLOR_SETTINGS`         | A subclass of `JSON_SETTINGS` designed for storing color themes            |
| `COMMON_SETTINGS`        | The settings available to every part of KiCad                              |
| `PROJECT_FILE`           | A `JSON_SETTINGS` representing a project (`.kicad_pro`) file               |
| `PROJECT_LOCAL_SETTINGS` | A `JSON_SETTINGS` representing a project local state (`.kicad_prl`) file   |

|===

== Where Settings are Stored

There are four main places a setting might be stored:

1. In `COMMON\_SETTINGS`: this is a setting that is shared between all parts of KiCad.
2. In an application settings object (subclass of `APP\_SETTINGS\_BASE`). These objects, such as

- ``EESchema_SETTINGS`` and ``PCBNEW_SETTINGS``, store settings that are specific to a portion of KiCad. In particular, these objects are compiled inside the context of their respective application, so they have access to data types that may not be part of ``common``.
3. In the ``PROJECT_FILE``, where they will be specific to a loaded project. This is true of most of the settings found in the Board / Schematic Setup dialogs. Currently, KiCad only supports having one project loaded at a time, and a number of places in the code expect that a ``PROJECT`` object will always be available. Because of this, the ``SETTINGS_MANAGER`` will always ensure that a "dummy" ``PROJECT_FILE`` is available even when no project has been loaded by the user. This dummy project can be modified in memory but not saved to disk.
  4. In the ``PROJECT_LOCAL_SETTINGS`` object, where they will be specific to a loaded project. This file is for settings that are "local state", such as which board layers are visible, that should (for many users, at least) not be checked in to source control. Any setting here should be transient, meaning there will be no ill effect if the entire file is deleted.

#### == JSON\_SETTINGS

The ``JSON_SETTINGS`` class is the backbone of the settings infrastructure. It is a subclass of the ``nlohmann::json::basic_json`` class provided by ``thirdparty/nlohmann_json/nlohmann/json.hpp``. As such, anytime raw manipulation of the underlying JSON data is needed, you can use the [https://nlohmann.github.io/json/api/basic\\_json/\[standard nlohmann::json API\]](https://nlohmann.github.io/json/api/basic_json/[standard%20nlohmann::json%20API]). The JSON contents represent the **state of the file on disk**, not the state of the data exposed to {cpp}. Synchronization between the two is done via parameters (see below) and takes place right after loading from disk and right before saving to disk.

#### == Parameters

Parameters establish the link between {cpp} data and content in the JSON file. In general, parameters consist of a **path**, **pointer**, and **default value**. The path is a string of the form ``"x.y.z"``, where each component represents a nested JSON dictionary key. The pointer is a pointer to the {cpp} member variable that holds the data accessible to consumers of the ``JSON_SETTINGS``. The default value is used to update the pointer when the data is missing from the JSON file.

Parameters are subclasses of ``PARAM_BASE`` in ``include/settings/parameters.h``. There are a number of helpful subclasses created to make it easier to store complex data in JSON files. The basic ``PARAM`` class is templated and is useful for storing any data type can be serialized to JSON automatically. A basic instantiation of a ``PARAM`` might look like:

[source,cpp]

```
...

 m_params.emplace_back(new PARAM<int>("appearance.icon_scale",
 &m_Appearance.icon_scale, 0));

...
```

Here, `m_Appearance.icon_scale` is a public member of the settings object (an `int` inside a `struct`). `"appearance.icon_scale"` is the **path** to store the value in the JSON file, and `0` is the default value. This would result in JSON looking like this:

[source,json]

```
...

 {
 "appearance": {
 "icon_scale": 0
 }
 }

...
```

Note that it is possible to use custom types with `PARAM<>` as long as they have a `to_json` and `from_json` defined. See `COLOR4D` for an example of this.

For storing complex data types, it is sometimes easiest to use `PARAM_LAMBDA<>`, which allows you to define a "getter" and "setter" as part of the parameter definition. You can use this to build a `nlohmann::json` object and store it as the "value" of your parameter. For examples of how this is done, see `NET_SETTINGS`.

## == NESTED\_SETTINGS

The `NESTED_SETTINGS` class is like a `JSON_SETTINGS` but instead of a file for a backing store, it uses another `JSON_SETTINGS` object. The entire contents of a `NESTED_SETTINGS` are stored as the value of a particular key in the parent file. This has two key benefits:

1. You can split up large sets of settings in to more manageable pieces
2. You can hide knowledge about the nested settings from the parent settings object

For example, many portions of the project file are stored as ``NESTED_SETTINGS`` objects inside the ``PROJECT_FILE``. These objects, including ``SCHEMATIC_SETTINGS``, ``NET_SETTINGS``, and ``BOARD_DESIGN_SETTINGS``, are compiled as part of `eeschema` or `pcbnew`, so they have access to data types not available in common (where ``PROJECT_FILE`` is compiled).

When the outer file is loaded, all of the data for the nested settings is there in the underlying ``nlohmann::json`` data store -- it's just not used until the appropriate ``NESTED_SETTINGS`` is loaded.

``NESTED_SETTINGS`` objects can have shorter lifecycles than the parent. This is required because in some cases (such as with the project file), the parent can stay resident in one frame (the KiCad manager, for example) while a frame that uses a nested settings inside it can be created and destroyed. When the nested settings is destroyed, it ensures that its data is stored to the JSON data of the parent. The parent ``JSON_SETTINGS`` can then be saved to disk, if desired.

== Schema Version and Migrations

Settings objects have a `**schema version**`, which is a const integer that can be incremented when a migration is needed. The schema version in the code is compared to that in the loaded file, and if the file version is lower (older), `**migrations**` are run to bring the data in the file up to date.

`**Migrations**` are functions that are responsible for making the necessary changes from one schema version to another. They act on the `**underlying JSON data**`, before parameter loading has taken place.

Migrations are not always needed when changing a settings file. You are free to add or remove parameters without changing the schema version or writing migrations. If you add parameters, they will be added to the JSON file and initialized to their default value. If you remove parameters, they will be silently dropped from the JSON file the next time the settings are saved. Migration is only needed when you need to make changes to the JSON file that depend on the current state. For example, if you decide to rename a settings key, but want to preserve the user's present setting.

If you need to make a "breaking change" to a settings file:

1. Increment the schema version
2. Write a migration that makes the necessary changes to the underlying ``nlohmann::json`` object
3. Call ``JSON_SETTINGS::registerMigration`` in the constructor for the object

title: S-Expressions

weight: 21

An s-expression is a text stream or string, in the same vein as XML, consisting of a sequence of elements. Each element is either an atom or list. An atom corresponds to a string, while a list corresponds to an s-expression.

The following grammar represents our definition of an s-expression:

```
sexpr  ::= ( sx )
sx      ::= atom sxtail | sexpr sxtail | NULL
sxtail  ::= sx | NULL
atom    :: quoted | value
quoted  :: "ws_string"
value   :: nws_string
```

An atom can either be a quoted string, which is a string containing whitespace surrounded by double quotes, or a non-whitespace string that does not require surrounding quotes.

The s-expression syntax used in Kicad uses two quoting/syntax strategies, given by the needs of the Specctra DSN specification and of our own non-specctra needs. The Specctra DSN specification is not very clear with regard to quoting and on top of that there is Freerouter's interpretation, which would actually supercede anything in the Specctra DSN spec anyway, due to a desire to be compatible with Freerouter.

We have our own needs, which go beyond those of the Specctra DSN spec, so we support the two syntaxes or quoting protocols for quoted atoms:

1. Specctra quoting protocol (specctraMode)
2. Kicad quoting protocol (non-specctraMode)

We can control our own destiny better by having a separately defined mode for non Specctra DSN files.

To summarize, in specctraMode Freerouter dictates to us what we need to do. In non-specctraMode, which can be thought of as Kicad mode, we have our own quoting protocol and can make changes without breaking the specctraMode.

There needs to be agreement between how a file is saved, and how a file is read back in, in either mode, to fulfill the round-tripping requirements. A file written using one mode may not necessarily be readable using the other mode, although it might be. Just don't count on it.

In Kicad mode:

OUTPUTFORMATTER::Quoted() is the tool to wrap s-expression atoms.

DSNLEXER::NextTok() is basically the inverse function, and reads tokens back in.

These two must agree, so that what is written out comes back in un-altered.

The decision to wrap the string or not is left to the Quoted() function. If the string is wrapped, it will also escape internal double quotes, \n's and \r's.

Any null string is wrapped in quotes, and so is any string which starts with

'#', so that it is not confused with an s-expression comment.

== Kicad S-expression Syntax and Quoting Protocol (non-specctraMode):

. Some atoms are considered keywords, and constitute a grammar superimposed on the s-expressions. All keywords are ASCII and lowercase. International characters are not to be used here.

. All Kicad s-expression files are saved using a UTF8 encoding and should

support any international characters in the atoms which are not keywords.

. DSNLEXER::NextTok() requires that any token be on a single line of input. If you want to save a multi-line string, Quoted() will automatically escape the \n

or `\r` for you and put the output on a single line. It should round-trip fine.

. There can be escape sequences in a quoted string only. Escape sequences allow foreign tools to generate byte patterns in the input stream. C style 2 byte hex codes are supported, and so are 3 byte octal escape sequences. See `DSNLEXER::NextTok()` for the full list of escape sequences, by searching file `dsnlexer.cpp` for the string "ESCAPE SEQUENCES". Any use of the escape mechanism must still produce UTF-8 encoded text after the escape handling is applied.

. Just because an escape sequence is supported on input, does not mean that `OUTPUTFORMATTER::Quoted()` must generate such an escape sequence for output. For example, having true tabs in the s-expression file is OK. So that will not be escaped on output. Other similar cases exist.

. Backslash is the escape byte.

title: Testing

weight: 20

:toc:

== Unit tests

KiCad has a limited number of unit tests, which can be used to check that certain functionality works.

Tests are registered using <https://cmake.org/cmake/help/latest/module/CTest.html>[CTest], part of CMake. CTest gathers all the

disparate test programs and runs them. Most {cpp} unit

tests are written using the https://www.boost.org/doc/libs/1_68_0/libs/test/doc/html/index.html[Boost Unit Test Framework] but this is not required to add a test to the testing suite.

The test CMake targets generally start with ``qa_``, the names of the tests within CTest are the same but without the ``qa_`` prefix.

=== Running tests

You can run all tests after building with ``make test`` or ``ctest``. The latter option allows many CTest options which can be useful, especially in automated or CI environments.

==== Running specific tests

To run a specific test executable, you can just run with ``ctest`` or run the executable directly. Running directly is often the simplest way when

working on a specific test and you want access to the test executable's arguments. For example:

```
[source,sh]
----

# run the libcommon tests
cd /path/to/kicad/build
qa/tests/common/qa_common [parameters]
----
```

For Boost unit tests, you can see the options for the test with `<test> --help`.
Common useful patterns:

- * `<test> -t "Utf8/*"` runs all tests in the `Utf8` test suite.
- * `<test> -t "Utf8/UniIterNull"` runs only a single test in a specific suite.
- * `<test> -l all` adds more verbose debugging to the output.
- * `<test> --list_content` lists the test suites and test cases within the test program. You can use these for arguments to `-t`.

You can rebuild just a specific test with CMake to avoid rebuilding everything when working on a small area, e.g. `make qa_common`.

==== Automated testing

The unit tests can be run on automated Continuous Integration (CI) systems.

By default, tests output human-readable results, which is useful when developing or debugging, but not so useful for automated test reporting.

Systems that can parse XML test results can enable these by setting the `KICAD_TEST_XML_OUTPUT` option to `ON`. The test results are then output as files ending in `.xml` in the `qa` subdirectory.

Test results are written to the build directory as follows:

- * Boost units tests: one XML file per test with the extension `.boost-results.xml`

* Python unit tests: one directory per test with the extension ``.xunit-results.xml``.

These directories contain one ``.xml`` file per Python test case file.

=== Writing Boost tests

Boost unit tests are straightforward to write. Individual test cases can be registered with:

[source,cpp]

```
BOOST_AUTO_TEST_CASE( SomeTest )
```

```
{
```

```
    BOOST_CHECK_EQUAL( 1, 1 );
```

```
}
```

There is a range of functions like ``BOOST_CHECK``, which are documented

https://www.boost.org/doc/libs/1_68_0/libs/test/doc/html/boost_test/utf_reference/testing_tool_ref.html

Using the most specific function is preferred, as that

allows Boost to provide more detailed failures: ``BOOST_CHECK( foo == bar )`` only reports a mismatch, ``BOOST_CHECK_EQUAL( foo, bar )`` will show the values of each.

To output debug messages, you can use ``BOOST_TEST_MESSAGE`` in the unit tests, which will be visible only if you set the ``.l`` parameter to ``.message`` or higher. This colours the text differently to make it stand out from other testing messages and standard output.

You can also use ``std::cout``, ``printf``, ``wxLogDebug`` and so on for debug messages inside tested functions (i.e. where you don't have access to the Boost unit test headers). These will always be printed, so take care to remove them before committing, or they'll show up when KiCad runs normally!

==== Expected failures

Sometimes, it is helpful to check in tests that do not pass. However, it is bad

practise to intentionally check in commits that break builds (which is what happens if you cause `make test` to fail).

Boost provides a method of declaring that some specific tests are allowed to fail. This syntax is not consistently available in all supported Boost versions, so you should use the following construct:

[source,cpp]

```
#include <unit_test_utils/unit_test_utils.h>
```

```
// On platforms with older boosts, the test will be excluded entirely
```

```
#ifdef HAVE_EXPECTED_FAILURES
```

```
// Declare a test case with 1 "allowed" failure (out of 2, in this case)
```

```
BOOST_AUTO_TEST_CASE( SomeTest, *boost::unit_test::expected_failures( 1 ) )
```

```
{
```

```
    BOOST_CHECK_EQUAL( 1, 1 );
```

```
// This check fails, but does not cause a test suite failure
```

```
    BOOST_CHECK_EQUAL( 1, 2 );
```

```
    // Further failures *would* be a test suit failure
```

```
}
```

```
#endif
```

When run, this produces output somewhat like this:

[source,sh]

```
qa/common/test_mytest.cpp(123): error: in "MyTests/SomeTest": check 1 == 2 has failed [1 != 2
```

```
*** No errors detected
```

And the unit test executable returns `0` (success).

Checking in a failing test is a strictly temporary situation, used to illustrate

the triggering of a bug prior to fixing it. This is advantageous, not only from a "project history" perspective, but also to ensure that the test you write to catch the bug in question does, in fact, catch the bug in the first place.

==== Assertions

It is possible to check for assertions in unit tests. When running the unit tests, ``wxASSERT`` calls are caught and re-thrown as exceptions. You can then use the ``CHECK_WX_ASSERT`` macro to check this is called in Debug builds. In Release builds, the check is not run, as ``wxASSERT`` is disabled in these builds.

You can use this to ensure that code rejects invalid input correctly.

=== Python modules

The Pcbnew Python modules have some test programs in the ``qa`` directory. You must have the ``KICAD_SCRIPTING_MODULES`` option on in CMake to build the modules and enable this target.

The main test script is ``qa/test.py`` and the test units are in ``qa/testcases``. All the test units can be run using ``ctest python``, which runs ``test.py``.

You can also run an individual case manually, by making sure the modules are built, adding them to ``PYTHONPATH`` and running the test from the source tree:

```
[source,sh]
----
make pcbnew_python_module
export PYTHONPATH=/path/to/kicad/build/pcbnew
cd /path/to/kicad/source/qa
python2 testcase/test_001_pcb_load.py
```

```
----
==== Diagnosing segfaults
```

Although the module is Python, it links against a {cpp} library (the same one used by KiCad Pcbnew), so it can segfault if the library has a defect.

You can run the tests in GDB to trace this:

```
[source,sh]
```

```
----
```

```
$ gdb
```

```
(gdb) file python2
```

```
(gdb) run testcases/test_001_pcb_load.py
```

```
----
```

If the test segfaults, you will get a familiar backtrace, just like if you were running pcbnew under GDB.

== Utility programs

KiCad includes some utility programs that can be used for debugging, profiling, analysing or developing certain parts of the code without having to invoke the full GUI program.

Generally, they are part of the `qa\_\*\_tools` QA executables, each one containing the relevant tools for that library. To list the tools in a given program, pass the `-l` parameter. Most tools provide help with the `-h` argument.

To invoke a program:

```
qa_<lib>_tools <tool name> [-h] [tool arguments]
```

Below is a brief outline of some available tools. For full information and command-line parameters, refer to the tools' usage test (`-h`).

- * `common\_tools` (the common library and core functions):

- * `coroutine`: A simple coroutine example

- * ``io_benchmark``: Show relative speeds of reading files using various IO techniques.
- * ``qa_pcbnew_tools`` (pcbnew-related functions):
 - * ``drc``: Run and benchmark certain DRC functions on a user-provided ``.kicad_pcb`` files
 - * ``pcb_parser``: Parse user-provided ``.kicad_pcb`` files
 - * ``polygon_generator``: Dump polygons found on a PCB to the console
 - * ``polygon_triangulation``: Perform triangulation of zone polygons on PCBs

== Fuzz testing

It is possible to run fuzz testing on some parts of KiCad. To do this for a generic function, you need to be able to pass some kind of input from the fuzz testing tool to the function under test.

For example, to use the <http://lcamtuf.coredump.cx/afl/> [AFL fuzzing tool], you will need:

- * A test executable that can:
 - * Receive input from ``stdin`` to be run by ``afl-fuzz``.
 - * Optional: process input from a filename to allow ``afl-tmin`` to minimise the input files.
- * To compile this executable with an AFL compiler, to enable the instrumentation that allows the fuzzer to detect the fuzzing state.

For example, the ``qa_pcbnew_tools`` executable (which contains ``pcb_parser``, a fuzz testing tool for ``.kicad_pcb`` file parsing) can be compiled like this:

```
[source,sh]
----
```

```
mkdir build
```

```
cd build
```

```
cmake -DCMAKE_CXX_COMPILER=/usr/bin/afl-clang-fast++ -DCMAKE_C_COMPILER=/usr/bin/afl-clang-fast ../kicad_
```

```
make qa_pcbnew_tools
```

```
----
```

You may need to disable core dumps and CPU frequency scaling on your system (AFL will warn you if you should do this). For example, as root:

[source,sh]

```
# echo core >/proc/sys/kernel/core_pattern
# echo performance | tee cpu*/cpufreq/scaling_governor
```

To fuzz, run the executable via ``afl-fuzz``:

```
afl-fuzz -i fuzzin -o fuzzout -m500 qa/pcbnew_tools/qa_pcbnew_tools pcb_parser
```

where:

- * ``-i`` is a directory of files to use as fuzz input "seeds"
- * ``-o`` is a directory to write the results (including inputs that provoke crashes or hangs)
- * ``-t`` is the maximum time that a run is allowed to take before being declared a "hang"
- * ``-m`` is the memory allowed to use (this often needs to be bumped, as KiCad code tends to use a lot of memory to initialise)

The AFL TUI will then display the fuzzing progress, and you can use the hang- or crash-provoking inputs to debug code as needed.

== Run-time debugging

KiCad can be debugged at run-time, either under a full debugger such as GDB, or using simple methods like logging debug to the console.

=== Printing debug

If you are compiling KiCad yourself, you can simply add debugging statements to relevant places in the code, for example:

```
wxLogDebug( "Value of variable: %d", my_int );
```

This produces debug output that can only be seen when compiling

in Debug mode.

You can also use ``std::cout`` and ``printf``.

Ensure you do not leave this kind of debugging in place when submitting code.

=== Printing trace

Some parts of the code have "trace" that can be enabled selectively according to a "mask", for example:

```
wxLogTrace( "TRACEMASK", "My trace, value: %d", my_int );
```

This will not be printed by default. To show it, set the ``WXTRACE`` environment variable when you run KiCad to include the masks you wish to enable:

```
$ WXTRACE="TRACEMASK,OTHERMASK" kicad
```

When printed, the debug will be prefixed with a timestamp and the trace mask:

```
11:22:33: Trace: (TRACEMASK) My trace, value: 42
```

If you add a trace mask, define and document the mask as a variable in ``include/trace_helpers.h``. This will add it to the link:[http://docs.kicad.org/doxygen/group\\$__trace__env__\\$vars.html](http://docs.kicad.org/doxygen/group$__trace__env__$vars.html)[trace mask documentation].

Some available masks:

* Core KiCad functions:

- * ``KICAD_KEY_EVENTS``
- * ``KicadScrollSettings``
- * ``KICAD_FIND_ITEM``
- * ``KICAD_FIND_REPLACE``
- * ``KICAD_NGSPICE``
- * ``KICAD_PLUGINLOADER``

- * `GAL\_PROFILE`
- * `GAL\_CACHED\_CONTAINER`
- * `PNS`
- * `CN`
- * `SCROLL\_ZOOM` - for the scroll-wheel zooming logic in GAL

* Plugin-specific (including "standard" KiCad formats):

- * `3D\_CACHE`
- * `3D\_SG`
- * `3D\_RESOLVER`
- * `3D\_PLUGIN\_MANAGER`
- * `KI\_TRACE\_CCAMERA`
- * `PLUGIN\_IDF`
- * `PLUGIN\_VRML`
- * `KICAD\_SCH\_LEGACY\_PLUGIN`
- * `KICAD\_GEDA\_PLUGIN`
- * `KICAD\_PCB\_PLUGIN`

== Advanced configuration

There are some advance configuration options, which are mostly used for development or testing purposes.

To set these options, you can create the file `kicad\_advanced` and set the keys as desired (the http://docs.kicad.org/doxygen/namespaceAC__KEYS.html [advanced config documentation] for a never need to set these keys for normal usage - if you do, that's a bug.

Any features enabled though the advanced configuration system are considered experimental and therefore unsuitable for production use. These features are explicitly not supported or considered fully tested. Issues are still welcome for defects discovered.

== Router debugging

The push and shove (PNS) router has some debugging tools.
 === PNG debug graphics

Setting the ``ShowRouterDebugGraphics`` advanced config enables graphics which show some internal state of the router:

`image::images/pns_debug_graphics.png[alt="Screenshot of PNS debug graphics"]`

=== PNS logging

There is a logging function that allows the router to store and save a log of events that can be used to replay the events that lead to a problem.

To create a PNS log dump:

- * Set the advanced config option ``EnableRouterDump=1`` and restart KiCad
- * During routing, after recreating the issue, press ``0``.
- * Save the ``pns.log`` file where you want

To view a PNS log, you need to build an extra tool:

- * Set the ``KICAD_BUILD_PNS_DEBUG_TOOL`` CMake setting to ``ON``
- * Build the ``pns_debug_tool`` tool
- * Run this tool with ``./qa/tools/pns/pns_debug_tool replay path/to/pns.log``

title: Tool Framework

weight: 18

:toc:

This document briefly outlines the structure of the tool system in the GAL canvases.

== Introduction

The GAL (Graphics Abstraction Layer) framework provides a powerful method of easily adding tools to KiCad. Compared to the older "legacy" canvas, GAL tools are more flexible, powerful and much easier to write.

A GAL "tool" is a class which provides one or more "actions" to perform. An action can be a simple one-off action (e.g. "zoom in" or "flip object"), or an interactive process (e.g. "manually edit polygon points").

Some examples of tools in the Pcbnew GAL are:

- * The selection tool - the "normal" tool. This tool enters a state where items can be added to a list of selected objects, which are then made available for other tools to act on.

(pcbnew/tools/selection_tool.cpp, pcbnew/tools/selection_tool.h)

- * The edit tool - this tool is active when a component is "picked up", and tracks the mouse position to allow the user to move a component.

Aspects of editing (e.g. flip) are also made available for use by hotkeys or other tools.

(pcbnew/tools/edit_tool.cpp,pcbnew/tools/edit_tool.h)

- * The drawing tool - this tool controls the process of drawing graphics elements such as line segments and circles.

(pcbnew/tools/drawing_tool.cpp,pcbnew/tools/drawing_tool.h)

- * The zoom tool - allows the user to zoom in and out.

== Major parts of a tool

There are two main aspects to tools: the actions and the the tool class.

=== Tool actions

The ``TOOL_ACTION`` class acts as a handle for the GAL framework to call on actions provided by tools. Generally, every action, interactive or not, has a ``TOOL_ACTION`` instance. This provides:

- * A "name", which is of the format ``pcbnew.ToolName.actionName``, which is used internally to dispatch the action
- * A "scope", which determines when the tools is available:
 - * ``AS_CONTEXT``, when the action is specific to a particular tool. For example, ``pcbnew.InteractiveDrawing.incWidth`` increases the width of a line while the line is still being drawn.
 - * ``AS_GLOBAL``, when the tool can always be invoked, by a hotkey, or during the execution of a different tool. For example, the zoom actions can be accessed from the selection tool's menu during the interactive selection process.
- * A "default hotkey", which is used if the user doesn't provide their own configuration.
- * A "menu item", which is the (translatable) string shown when this tool is accessed from a menu.
- * A "menu description", which is the string shown in the menu item's tooltip and provides a more detailed description if needed.
- * An "icon", which is shown in menus and on buttons for the action
- * "Flags" which include:
 - * ``AF_ACTIVATE`` which indicates that the tool enters an active state. When

a tool is active it will keep receiving UI events, such as mouse clicks or key presses, which are normally handled in an event loop (see `TOOL_INTERACTIVE::Wait()`).

- * A parameter, which allows different actions to call the same function with different effects, for example "step left" and "step right".

=== The tool class

GAL tools inherit the ``TOOL_BASE`` class. A Pcbnew tool will generally inherit from ``PCB_TOOL``, which is a ``TOOL_INTERACTIVE``, which is a ``TOOL_BASE``. Eeschema tools inherit directly from ``TOOL_INTERACTIVE``.

The tool class for a tool can be fairly lightweight - much of the functionality is inherited from the tool's base classes. These base classes provide access to several things, particularly:

- * Access to the parent frame (a ``wxWindow``, which can be used to modify the viewport, set cursors and status bar content, etc.
 - * Use the function ``getEditFrame<T>()``, where ``T`` is the frame subclass you want. In ``PCB_TOOL``, this is likely ``PCB_EDIT_FRAME``.
- * Access to the ``TOOL_MANAGER`` which can be used to access other tools' actions.
- * Access to the "model" (some sort of ``EDA_ITEM``) which backs the tool.
 - * Access with ``getModel<T>()``. In ``PCB_TOOL``, the model type ``T`` is ``BOARD``, which can be used to access and modify the PCB content.
- * Access to the ``KIGFX::VIEW`` and ``KIGFX::VIEW_CONTROLS``, which are used to manipulate the GAL canvas.

The major parts of tool's implementation are the functions used by the ``TOOL_MANAGER`` to set up and manage the tool:

- * Constructor and destructor to establish whatever class members are required.
- * The `TOOL_BASE` class requires a string to be passed for the tool name, which normally looks like ``pcbnew.ToolName``.

- * ``Init()`` function (optional), which is commonly used to fill in a context menu, either belonging to this tool, or access another tool's menu and add items to that. This function is called once, when the tool is registered with the tool manager.
- * ``Reset()`` function, called when the model (e.g. the ``BOARD``) is reloaded, when the GAL canvas is switched, and also just after tool registration. Any resource claimed from the GAL view or the model must be released in this function, as they could become invalid.
- * ``setTransitions()`` function, which maps tool actions to functions within the tool class.
- * One or more functions to call when actions are invoked. Many actions can invoke the same function if desired. The functions have the following signature:
 - * `int TOOL_CLASS::FunctionName( const TOOL_EVENT& aEvent )`
 - * Returning 0 means success.
 - * These functions are called by the ``TOOL_MANAGER`` in case an associated event arrives (association is created with `TOOL_INTERACTIVE::Go()` function).
 - * These can generally be private, as they are not called directly by any other code, but are invoked by the tool manager's coroutine framework according to the ``setTransitions()`` map.

=== Interactive actions

The action handlers for an interactive actions handle repeated actions from the tool manager in a loop, until an action indicating that the tool should exit.

Interactive tools also normally indicate that they are active with a cursor change and by setting a status string.

[source,cpp]

```
int TOOL_NAME::someAction( const TOOL_EVENT& aEvent )
{
    auto& frame = *getEditFrame<PCB_EDIT_FRAME>();
```

```

// set tool hint and cursor (actually looks like a crosshair)
frame.SetToolID( ID_LOCAL_RATSNEST_BUTT,
                 wxCURSOR_PENCIL, _( "Select item to move left" ) );
getViewControls()->ShowCursor( true );

// activate the tool, now it will be the first one to receive events
// you can skip this, if you are writing a handler for a single action
// (e.g. zoom in), opposed to interactive tool that requires further
// events to operate (e.g. dragging a component)
Activate();

// the main event loop
while( OPT_TOOL_EVENT evt = Wait() )
{
    if( evt->IsCancel() || evt->IsActivate() )
    {
        // end of interactive tool
        break;
    }
    else if( evt->IsClick( BUT_LEFT ) )
    {
        // do something here
    }
    // other events...
}

// reset the PCB frame to how it was when we got it
frame.SetToolID( ID_NO_TOOL_SELECTED, wxCURSOR_DEFAULT, wxEmptyString );
getViewControls()->ShowCursor( false );

return 0;
}

----
=== The tool menu
Top level tools, i.e. tools that the user enters directly, usually
provide their own context menu. Tools that are called only from other

```

tools' interactive modes add their menu items to those tools' menus.

To use a ``TOOL_MENU`` in a top level tool, simply add one as a member and initialize it with a reference to the tools at construction time:
[source,cpp]

```
class TOOL_NAME: public PCB_TOOL
{
public:
    TOOL_NAME() :
        PCB_TOOL( "pcbnew.MyNewTool" ),
        m_menu( *this )
    {}

```

```
private:

```

```
    TOOL_MENU m_menu;

```

```
}
```

You can then add a menu accessor, or provide a custom function to allow other tools to add any other actions, or a subset that you think appropriate.

You can then invoke the menu from an interactive tool loop by calling ``m_menu.ShowContextMenu()``. Clicking on the tool's entry in this menu will trigger the action - there is no further action needed in your tool's event loop.

Commit objects

The ``COMMIT`` class manages changes to ``EDA_ITEMS``, which combines changes on any number of items into a single undo/redo action.

When editing PCBs, changes to the PCB are managed by the derived ``BOARD_COMMIT`` class.

This class takes either a ``PCB_BASE_FRAME`` or a ``PCB_TOOL`` as an argument. Using ``PCB_TOOL`` is more appropriate for a GAL tool, since there's no need to go through a frame class if not required.

The procedure of a commit is:

- * Construct an appropriate ``COMMIT`` object
- * Before modifying any item, add it to the commit with ``Modify( item )`` so that the current item state can be stored as an undo point.
- * When adding a new item, call ``Add( item )``. Do not delete the added item, unless you are going to abort the commit.
- * When removing an item, call ``Remove( item )``. You should not delete the removed item, it will be stored in the undo buffer.
- * Finalize the commit with ``Push( "Description" )``. If you performed no modifications, additions or removals, this is a no-op, so you don't need to check if you made any changes before pushing.

If you want to abort a commit, you can just destruct it, without calling ``Push()``. The underlying model won't be updated.

As an example:

[source,cpp]

```
// Construct commit from current PCB_TOOL
```

```
BOARD_COMMIT commit( this );
```

```
BOARD_ITEM* modifiedItem = getSomeItemToModify();  
// tell the commit we're going to change the item
```

```
commit.Modify( modifiedItem );
```

```
// update the item
```

```
modifiedItem->Move( x, y );
```

```
// create a new item
```

```

PCB_SHAPE* newItem = new PCB_SHAPE;

// ... set up item here

// add to commit
commit.Add( newItem );

// update the model and add the undo point
commit.Push( "Modified one item, added another" );
-----

== Tutorial: Adding a new tool

```

Without getting too heavily into the details of how the GAL tool framework is implemented under the surface, let's look at how you could add a brand new tool to Pcbnew. Our tool will have the following (rather useless) functions:

- * An interactive tool which will allow the user to select a point, choose from the items at that point and then move that item 10mm to the left.
- * While in this mode, the context menu will have more options:
 - * Use of the "normal" canvas zoom and grid options
 - * A non-interactive tool which will add a fixed circle at a fixed point.
 - * A way to invoke the non-interactive "unfill all zones" tool from the PCB_EDITOR_CONTROL tool.

```
## Declare tool actions {#declare-actions}
```

The first step is to add tool actions. We will implement two actions named:

- * ``Pcbnew.UselessTool.MoveItemLeft`` - the interactive tool
 - * ``Pcbnew.UselessTool.FixedCircle`` - the non-interactive tool.
- The "unfill tool" already exists with the name

```
`pcbnew.EditorControl.zoneUnfillAll`.
```

This guide assumes we will be adding a tool to Pcbnew, but the procedure for other GAL-capable canvases will be similar.

In ``pcbnew/tools/pcb_actions.h``, we add the following to the ``PCB_ACTIONS`` class, which declares our tools:

```
[source,cpp]
```

```
----
```

```
static TOOL_ACTION uselessMoveItemLeft;
```

```
static TOOL_ACTION uselessFixedCircle;
```

```
----
```

Definitions of actions generally happen in the `.cpp` of the relevant tool.

It doesn't actually matter where the definition occurs (the declaration is enough to use the action), as long as it's linked in the end.

Similar tools should always be defined together.

In our case, since we're making a new tool, this will be in ``pcbnew/tools/useless_tool.cpp``. If adding actions to existing tools, the prefix of the tool string (e.g. ``"Pcbnew.UselessTool"``) will be a strong indicator as to where to define the tool.

The tools definitions look like this:

```
[source,cpp]
```

```
----
```

```
TOOL_ACTION COMMON_ACTIONS::uselessMoveItemLeft(  
    "pcbnew.UselessTool.MoveItemLeft",  
    AS_GLOBAL, MD_CTRL + MD_SHIFT + int( 'L' ),  
    _( "Move item left" ), _( "Select and move item left" ) );
```

```
TOOL_ACTION COMMON_ACTIONS::uselessFixedCircle(  
    "pcbnew.UselessTool.FixedCircle",
```

```
AS_GLOBAL, MD_CTRL + MD_SHIFT + int( 'C' ),
_( "Fixed circle" ), _( "Add a fixed size circle in a fixed place" ),
add_circle_xpm );
----
```

We have defined hotkeys for each action, and they are both global. This means you can use ``Shift+Ctrl+L`` and ``Shift-Ctrl-C`` to access each tool respectively.

We defined an icon for one of the tools, which should appear in any menu the item is added to, along with the given label and explanatory tooltip.

We now have two actions defined, but they are not connected to anything. We need to define a functions which implement the right actions. You can add these to an existing tool (for example `PCB_EDITOR_CONTROL`, which deals with many general PCB modification operation like zone filling), or you can write a whole new tool to keep things separate and give you more scope for adding tool state.

We will write our own tool to demonstrate the process.

=== Add tool class declaration

Add a new tool class header ``pcbnew/tools/useless_tool.h`` containing the following class:

[source, cpp]

```

-----
class USELESS_TOOL : public PCB_TOOL
{
public:
    USELESS_TOOL();

    ~USELESS_TOOL();
    ///< React to model/view changes

```

```

void Reset( RESET_REASON aReason ) override;

///< Basic initialization

bool Init() override;
///< Bind handlers to corresponding TOOL_ACTIONS

void setTransitions() override;

private:

    ///< 'Move selected left' interactive tool

    int moveLeft( const TOOL_EVENT& aEvent );

    ///< Internal function to perform the move left action

    void moveLeftInt();

    ///< Add a fixed size circle

    int fixedCircle( const TOOL_EVENT& aEvent );

    ///< Menu model displayed by the tool.

    TOOL_MENU m_menu;
};
-----

```

=== Implement tool class methods

In the `pcbnew/tools/useless\_tool.cpp`, implement the required methods.
 In this file, you might also add free function helpers, other classes,
 and so on.

You will need to add this file to the `pcbnew/CMakeLists.txt` to
 build it.

Below you will find the contents of useless_tool.cpp:

[source,cpp]

```

#include "useless_tool.h"

#include <class_draw_panel_gal.h>
#include <view/view_controls.h>
#include <view/view.h>
#include <tool/tool_manager.h>
#include <board_commit.h>

// For frame ToolID values
#include <pcbnew_id.h>

// For action icons
#include <bitmaps.h>

// Items tool can act on
#include <class_board_item.h>
#include <class_drawsegment.h>

// Access to other PCB actions and tools
#include "pcb_actions.h"
#include "selection_tool.h"

/*
 * Tool-specific action definitions
 */

TOOL_ACTION PCB_ACTIONS::uselessMoveItemLeft(
    "pcbnew.UselessTool.MoveItemLeft",
    AS_GLOBAL, MD_CTRL + MD_SHIFT + int( 'L' ),
    _( "Move item left" ), _( "Select and move item left" ) );

TOOL_ACTION PCB_ACTIONS::uselessFixedCircle(
    "pcbnew.UselessTool.FixedCircle",
    AS_GLOBAL, MD_CTRL + MD_SHIFT + int( 'C' ),
    _( "Fixed circle" ), _( "Add a fixed size circle in a fixed place" ),

```

```

        add_circle_xpm );

/*
 * USELESS_TOOL implementation
 */

USELESS_TOOL::USELESS_TOOL() :
    PCB_TOOL( "pcbnew.UselessTool" ),
    m_menu( *this )
{
}

USELESS_TOOL::~~USELESS_TOOL()
{
}

void USELESS_TOOL::Reset( RESET_REASON aReason )
{
}

bool USELESS_TOOL::Init()
{
    auto& menu = m_menu.GetMenu();

    // add our own tool's action
    menu.AddItem( PCB_ACTIONS::uselessFixedCircle );

    // add the PCB_EDITOR_CONTROL's zone unfill all action
    menu.AddItem( PCB_ACTIONS::zoneUnfillAll );

    // Add standard zoom and grid tool actions
    m_menu.AddStandardSubMenus( *getEditFrame<PCB_BASE_FRAME>() );
    return true;
}

```

```

void USELESS_TOOL::moveLeftInt()

```
=== Register the tool
```

The last step is to register the tool in the tool manager.
This is done in the frame's ``setupTools()`` function for whichever
``EDA_DRAW_FRAME`` support that tool.

=== Build and run

When this is all done, you should have modified the following files:

- * ``pcbnew/tools/common_actions.h`` - action declarations
- * ``pcbnew/tools/useless_tool.h`` - tool header
- * ``pcbnew/tools/useless_tool.cpp`` - action definitions and tool implementation
- * ``pcbnew/tools/tools_common.cpp`` - registration of the tool
- * ``pcbnew/CMakeLists.txt`` - for building the new .cpp files

When you run Pcbnew, you should be able to press ``Shift+Ctrl+L`` to enter the "move item left" tool - the cursor will change to a crosshair and "Select item to move left" appears in the bottom right corner.

When you right-click, you get a menu, which contains an entry for our "create fixed circle" tool and one for the existing "unfill all zones" tool which we added to the menu. You can also use ``Shift+Ctrl+C`` to access the fixed circle action.

Congratulations, you have just created your first KiCad tool!

weight: 50

.Summary The printed circuit board file format prior to version 4.0.

<!--more-->

WARNING: This is for the PCB file format before the S expression format introduced in KiCad 4.0.

This documentation is a mostly verbatim copy of what was written back then and the quality may be poor. This is only included as a reference and is not maintained.

==■Information about V1 version:

* Board files (*.brd files) are in ASCII format.

* Dimensions are in 1/10000 inch, except for the page size (in 1/1000 inch).

First line is something as:

PCBNEW-BOARD Version 1 date 02/04/2011 15:04:20

All the following descriptions are like this:

```

\$DESCRIPTION

some data

...

\$endDESCRIPTION

```

When <DESCRIPTION> is an identifier which gives the meaning of the data between \$DESCRIPTION and \$endDESCRIPTION.

Example:

...

\$GENERAL

encoding utf-8

Rev ""

Comp ""

Comment1 ""

Comment2 ""

Comment3 ""

Comment4 ""

\$EndSHEETDESCR

...

== ■Information about V2 version:

The file format is exactly the same format, and the extension is still .brd.

However, dimensions are in mm (floating notation), except for the page size (in 1/1000 inch).

Because the internal Pcbnew unit is now 1nm, the integer coordinates in 1/10000 inch cannot be used in files. Of course, the Pcbnew versions which are in nm are able to read the V1 version files, but can only write files in V2 version. The V2 version should be seen as a temporary

way to store boards without loss of resolution.

First line is something as:

`PCBNEW-BOARD Version 2 date 22/02/2013 15:04:20`

All the following descriptions are like this:

```

\$DESCRIPTION

some data

...

\$endDESCRIPTION

```

Example:

```

PCBNEW-BOARD Version 2 date 22/02/2013 10:33:30

```

== Information about new "S expression" version:

For Pcbnew versions in nanometers, the default file format is now using "S expressions".

This new format uses mm for coordinates, fixes issues (like spaces in names) in V1 and V2

versions, and is more human readable than the older format. The new file extension is .kicad_pcb

Here is a sample:

...

```
(kicad_pcb (version 3) (host pcbnew "(2013-01-12 BZR 3902)-testing")
```

```

    (company Kicad)
  )
```

...

== ■Layer numbering:

Tracks and other items (texts, drawings ...) use one layer.

Pads and vias use several layers.

There are 16 copper layers and 13 technical layers.

The layer parameter used in descriptions has the value:

|===

|value|■layer name |

|0■|Copper layer .3+|"Copper" layers
 |1 to 14|■Inner layers
 |15| Component layer
 |16■|Copper side adhesive layer .16+|"Technical" layers
 |17■|Component side adhesive layer
 |18■|Copper side Solder paste layer
 |19■|Component Solder paste layer
 |20■|Copper side Silk screen layer
 |21■|Component Silk screen layer
 |22■|Copper side Solder mask layer
 |23■|Component Solder mask layer
 |24■|Draw layer (Used for general drawings)
 |25■|Comment layer (Other layer used for general drawings)
 |26■|EC01 layer (Other layer used for general drawings)
 |27■|EC02 layer (Other layer used for general drawings)
 |28■|Edge layer. Items on Edge layer are seen on all layers
 |29■|Not yet used
 |30■|Not yet used
 |31■|Not yet used
 |===

Mask layer:

Sometimes, a mask layer parameter is used.

It is a 32 bits mask used to indicate a layer group usage (0 up to 32 layers).

A mask layer parameter is given in hexadecimal form.

Bit 0 is the copper layer, bit 1 is the inner 1 layer, and so on...(Bit 27 is the Edge layer).

Mask layer is the ORed mask of the used layers

                                name = name given to the layer by the user (here: "cuivre" +
                                type = signal (not current used in Pcbnew)

| Layer[15] Composant signal |

| TrackWidth 250 | Current track width

| TrackWidthHistory 170 .3+|Last used track widths

| TrackWidthHistory 250

| TrackWidthHistory 400

| TrackClearence 100 | Isolation for DRC (Design rules check)

| ZoneClearence 200■| Isolation used in zone filling

| DrawSegmWidth 120■| Current segment width for drawings on technical layers

| EdgeSegmWidth 120■| Current segment width for drawings on "edge layer"

| ViaSize 700 | Current via size

| ViaDrill 250 | Via drill for this board

| ViaSizeHistory 450 .3+|Last used via sizes

| ViaSizeHistory 650

| ViaSizeHistory 700

| TextPcbWidth 120 | Current text width for texts on copper or technical layers. This is not for text on t
| TextPcbSize 600 600 | Current text X Y size

| EdgeModWidth 120 | Current Segment width for footprint edition

| TextModSize 120 600 | Current text XY size for texts for footprint edition

| TextModWidth 120 | Current text width for texts for footprint edition

| PadSize 700 700 | Current X Y pad size (footprint edition)

| PadDrill 320 | Current pad drill

| AuxiliaryAxisOrg 0 0 | Auxiliary axis position +
                                (Auxiliary axis is the reference coordinate (0 0 coordinate) for EXCELLON drilling)

| $EndSETUP■| End block "SETUP"

|===

==■$EQUIPOT
$EQUIPOT describes a net name.

```

```

|===
|$EQUIPOT | Start block

|Na 2 "N-000026"| Na <internal net number> « net name »

|St ~ |

|$EndEQUIPOT | End block

|===

```

Note1:

Internal net number is an arbitrary number.

It is computed by Pcbnew when compiling netlist.

Note2:

Net 0 is not a real net.

Net 0 is the net number used internally by Pcbnew for all the no connected pads.

Example:

```

...

$EQUIPOT;

Na 0 ""

St ~

$EndEQUIPOT

$EQUIPOT

Na 1 "DONE"

St ~

$EndEQUIPOT

$EQUIPOT

Na 2 "N-000026"

St ~

$EndEQUIPOT

$EQUIPOT

Na 3 "TD0/PROG"

St ~

$EndEQUIPOT

...

```

==■\$MODULE

Description start by:

```
`$MODULE <module name>``
```

And ends with

```
`$EndMODULE <module name>``
```

Module description has four sections:

1. ■ General description (fixed size)
2. ■ Field description (variable size)
3. ■ Drawing description (variable size)
4. ■ Pad description. (variable size)
5. ■ 3D shape information.

Note:

All coordinates are relative to the module position.

Its means the coordinates of segments, pads, texts ... are given for a module in position 0, rotation 0. If a module is rotated or mirrored, real coordinates must be computed according to the real position and rotation.

=== ■ General description:

|===

|\$MODULE bornier6 | \$MODULE <module lib name>

|Po 62000 30500 2700 15 3EC0C28A 3EBF830C ~-■| Po Xpos Ypos Orientation(0.1deg) Layer TimeStamp Attribut1

Attribut1 = ~or 'F' for autoplacement (F = Fixed, ~= moveable)

Attribut2 = ~or 'P' for autoplacement (P = autoplaced)

|Li bornier6 | Li <module lib name>

|Cd Bornier d'alimentation 4 pins | Cd comment description (displayed when browsing libraries)

|Kw DEV■| Kw Keyword1 Keyword2 ... (for footprint selection by keywords)

|Sc 3EBF830C | Sc TimeStampOp

|Op 0 0 0■| Op <rotation cost 90 deg> <rotation cost 180 deg> for auto place. +

rotation cost = 0 (no rotation allowed) to 10 (null cost)

|===

Note:

Usually, components are on layer 15 (component layer) or 0 (copper layer).

If the component is on layer 0, it is "mirrored". The "mirror axis is the X axis

===■Field Description:

There are 2 to 12 fields

Field 0 = component reference (U1, R5 ...) (required)

Field 1 = component value (10K, 74LS02 ...) (required)

Other fields (optional) are comments.

Format:

```
`T<field number> <Xpos> <Ypos> <Xsize> <Ysize> <rotation> <penWidth> N <visible> <layer> "text"``
```

|===

|Field|■Units|■Meaning

|field number|■enumeration|■0=>reference, 1=>value, etc.

|Xpos|■tenths of mils (.0001 inches)|■The horizontal offset relative to the module's overall position

|Ypos|■tenths of mils (.0001 inches)|■The vertical offset relative to the module's overall position

|Xsize|■tenths of mils (.0001 inches)|■The horizontal size of the character 'M'

|Ysize|■tenths of mils (.0001 inches)|■The vertical size of the character 'M'

|rotation|■tenths of degrees|■Angular rotation from horizontal, counterclockwise

|penWidth|■tenths of mils (.0001 inches)|■Width of the pen used to draw characters

|N|■none|■flag for the parser?

|visible|■boolean|■I=> invisible, V=> visible

|layer|■enumeration|■see layer numbers above

|===

Examples:

|===

|T0 500 -3000 1030 629 2700 120 N V 21 "P1"■|T0 => reference

|T1 0 3000 1201 825 2700 120 N V 21 "CONN_6"■|T1 => value

|===

===■Drawings:

Tells how to draw module shape.

They cannot be on a copper layer (DRC ignore them)

Drawings are segment, circle, arc, polygon.

==== ■Draw segment:

|===

|DS -6000 -1500 -6000 1500 120 21■| DS is a Draw Segment +

DS Xstart Ystart Xend Yend Width Layer

|DS 6000 1500 6000 -1500 120 21 ■| An other Draw Segment

|===

==== ■Circle:

|===

|DC Xcentre Ycentre Xpoint Ypoint Width Layer■| DC is a Draw Circle +

Xpoint, Ypoint is a point on the circle.

|===

==== Arc:

|===

|DA Xcentre Ycentre Xstart_point Ystart_point angle width layer■| DA is a Draw Arc +

angle is the arc angle in 0.1 deg

|===

==== Polygon:

|===

|DP 0 0 0 0 corners_count width layer | Draw Polygon +

First line of a polygon. +

The polygon should be closed, otherwise this is a poly-line. .

width is the thickness of outlines.

| D1 corner_posx corner_posy | Corner coordinate +

(corners_count lines like this)

|===

====■Pad Descriptions:

All the pads of this footprint are listed here (Many \$PAD/\$EndPAD sections here)..

See \$PAD description.

==== ■\$SHAPE3D

3D shape information:

The real shape description is a vrml file, build by Wings3d.

This shape can be scaled, moved and rotated.

This is because a single 3D shape can be used for many footprints (for instance, we use the shape resistor.wrl for several resistor footprints, by tuning the X, Y, Z scale of the 3D shape according to the different size of resistor footprints). Some smd footprints are using this feature. For the same reasons, the 3D shape can be moved (by the move factor) and/or rotated. *Real shape unit is 0.1 inch (1 unit vrml = 0.1 inch = 2.54 millimeter).*

An other reason exists: when a footprint is very big (a big connector) or very small (a small SMD resistor) we must create a 3D shape small or bigger than real size, in order to use easily the 3D modeler.

|===

|\$SHAPE3D | Start description

|Na "device/bornier_6.wrl" | FileName (default path is kicad/modules/packages3d/)

|Sc 1.000000 1.000000 1.000000 | X Y Z scale factor

|Of 0.000000 0.000000 0.000000 | X Y Z offset (move vector, in 3D units (0.1 inch))

|Ro 0.000000 0.000000 0.000000 | X Y Z rotation (in degree)

|\$EndSHAPE3D | End description

|===

The 3D shape coordinates are relative to the footprint coordinates.

The 3D shape must be scale, moved and rotated according to the parameters Sc Of and Ro, and after moved and rotated according to the footprint coordinates and rotation.

If the footprint is « inverted » (that is, located on copper side) the 3D shape must be « inverted » too.

NOTE: A footprint may have several 3D shapes (for instance an integrated circuit and his socket).

====■\$PAD

Pads have different shapes and attributes.

Pad shapes are:

- * Circle.
- * Oblong(or oval).
- * Rectangular (Square is like a rectangle).
- * Trapeze.

Pad attributes are:

- * Normal (Has usually a hole)
- * Smd (used for Surface Mounted Devices). Has no hole.
- * Connector (used for connectors like a PC Board Bus connector)
- * Mechanical. (Like a hole for mechanical use)

And shape can be draw with an offset related to the drilling hole.

The hole shale is round or oblong

|===

|\$PAD█| Start description

or (oblong hole) +

Drill <Pad drill.x> Xoffset Yoffset <Hole shape> <Pad drill.x> <Pad drill.y>

|At STD N 00E0FFFF█| Attributs: <Pad type> N <layer mask>

|Ne 8 "GND" | Net reference of the pad: <netnumber> <net name>

|Po -3000 0█| X_pos Y_pos (relative to the module position)

|\$EndPAD | End description

|===

Note:

<Pad type> is the Pad Attribute. It is one of: "STD" "SMD" "CONN" "HOLE" "MECA".

Shape is one of:

- * C (circle)
- * R (Rectangular).

* 0 (Oblong)

* T (Trapèze)

Hole shape = 0 (0 for Oblong)

Example:

...

\$PAD

Sh "3" C 1500 1500 0 0 2700

Dr 600 0 0

At STD N 00E0FFFF

Ne 10 "TD0_1"

Po -1000 0

\$EndPAD

...

==■Graphic items:

There are drawing items like segments, circles, texts, targets and cotations.

=== \$DRAWSEGMENT

Draw segments are:

* segments (strait line)

* circles

* arcs

==== Line:

|===

|\$DRAWSEGMENT | Start description

|Po 0 67500 39000 65500 39000 120 | Position shape Xstart Ystart Xend Yend width

|De 28 0 900 0 0 | Description layer type angle timestamp status

|\$EndDRAWSEGMENT | End description

|===

Note:

* shape = 0

* Angle is used only for arc segments (unused for line, left for compatibility).

==== Circle:

|===

|\$DRAWSEGMENT | Start description

|Po 1 67500 39000 65500 39000 120 | Position shape Xcentre Ycentre Xend Yend width

|De 28 0 900 0 0 | Description layer type angle timestamp status

|\$EndDRAWSEGMENT | End description

|===

Note:

* shape = 1

* Angle is used only for arc segments (unused for circle, left for compatibility).

* End is a point of this circle. (If Xend or Yend is 0, the other coordinate is the radius)

==== Arc:

|===

|\$DRAWSEGMENT | Start description

|Po 2 67500 39000 65500 39000 120 | Position shape Xstart Ystart Xend Yend width

|De 28 0 900 0 0 | Description layer type angle timestamp status

|\$EndDRAWSEGMENT | End description

|===

Note:

* shape = 2

* start and end are the 2 points of the arc. angle is the arc angle (in 0.1 degree).

Center coordinates are computed by pcbnew from start, end and angle.

Currently, only 90 degrees arcs are supported.(thereby, angle = 900)

Example:

```\n

\$DRAWSEGMENT

Po 0 67500 34000 67500 39000 120

De 28 0 900 0

\$EndDRAWSEGMENT

...

===■\$TEXTPCB

|===

|\$TEXTPCB | Start description

|Te "TDI" | Text "string"

|Po 57250 35750 600 600 150 0 |■Position Xstart Ystart Xsize Ysize Width rotation

| S1 0 73000 6501 72557 6731 150

| S2 0 73000 6501 72557 6271 150

| S3 0 27500 6501 27943 6731 150

| S4 0 27500 6501 27943 6271 150

| \$EndCOTATION■| End description

|===

==■Track, vias and Zone section:

===■\$TRACK

Track section describes tracks and vias on copper layers.

Each track (or via) has a two line description:

For a track segment:

\*\*Po\*\*sition shape Xstart Ystart Xend Yend width +

\*\*De\*\*scription layer 0 netcode timestamp status

Shape parameter is set to 0 (reserved for future changes).

For a via:

\*\*Po\*\*sition shape Xstart Ystart Xend Yend diameter +

\*\*De\*\*scription layer 1 netcode timestamp status

For a via, layer parameter gives :

On the 4 less significant bits: the starting layer of the via +

On the 4 next bits: the ending layer.

For instance, a via starting at copper kayer (layer 0) end ending at component layer

(layer 15 has the layer parameter set to F0 hexadecimal or 240 decimal. + Shape parameter

is the via type (through = 3, blind = 2, buried = 1) + Timestamp parameters are set to 0

(reserved for future changes). +

Status parameter can be set to 0 (Used internally for routing information).

|===

|\$TRACK■ | Start description

|Po 0 36750 37000 36550 37000 250■| Position shape Xstart Ystart Xend Yend width

width = diameter for a via

|De 15 0 1 0 400■ | Description layer type netcode timestamp status +

type = 0 for a track segment. +

type = 1 for a via

|Po 0 39000 36750 38750 37000 250 .2+| An other track

|De 15 0 1 0 0

|Po 3 53500 27000 53500 27000 650 .2+|This is a via (via "through") from layer 15 (component) to layer 0

|De 15 1 14 0 0

|\$EndTRACK | End description

|===

=== ■\$ZONE

Zone section is like track section. (There is no via in Zone section).

It is used to handle a zone filling, from a zone outline.

|===

|\$ZONE |■Start description

|Po 0 67100 33700 67100 38600 100 .2+| Same as track description

|De 0 0 2 3EDDB09D 0

|\$EndZONE |■End description

|===

===■\$CZONE\_OUTLINE

Describes the main outlines of a zone and the outlines of filled areas (solid polygons)

inside the zone main outlines. Outlines of filled areas can be missing (if the zone is not currently filled). Because a zone handles thermal reliefs, there are options to describe pads in zones options and thermal reliefs parameters.

Example:

...

\$CZONE\_OUTLINE

ZInfo 47868246 1 "GND"

---

:TOC:

.Summary The s-expression footprint library file format.

<!--more-->

== Introduction

This documents the s-expression footprint library file format for all versions of KiCad from 6.0.

\* Footprint library files use the `.kicad\_mod` extension.

\* Footprint library files can only define a single footprint.

\* Footprint libraries are defined a folder containing one or more footprint library files.

NOTE: This file format was introduced with the launch of KiCad 4.0.

NOTE: Prior to version 6 of KiCad, strings were only quoted when necessary. Saving an older board file to the latest file format will result in these strings being quoted even though there is no functional change in the board itself.

== Layout

A footprint library file includes the following sections:

\* <<\_header\_section,Header>>

\* <<\_footprint\_section,Footprint Definition>>

## == Header Section

The ``footprint`` token indicates that it is KiCad footprint library file. This section is required.

NOTE: Third party scripts should not use ``pcbnew`` as the generator identifier. Please use some other identifier so that bugs introduced by third party generators are not confused with a footprint library file created by KiCad.

```
...

(footprint "NAME" <1>
 (version VERSION) <2>
 (generator GENERATOR) <3>

 ;; contents of the footprint library file... <4>
)
...
```

<1> The footprint ``NAME`` is a quoted string that defines the name of the footprint.

<2> The ``version`` token attribute defines the board version using the YYYYMMDD date format.

<3> The ``generator`` token attribute defines the program used to write the file.

<4> The footprint definition goes here.

## == Footprint Section

See the `xref:../sexpr-intro/index.adoc#_footprint[footprint]` in the s-expression board common definitions.

## Arquivo: KnowledgePack-20250920-1710\downloads\kicad-dev-docs\content\file-formats\sexpr-intro\ index.en.adoc

*Resumo: --- title: S-Expression Format weight: 41 --- :TOC: .Summary An introduction to the s-expression file format. <!--more--> == Introduction KiCad uses an s-expression file format for symbol libraries, footprint libraries, schematics, printed circuit boards, and title block and border ...*

---

title: S-Expression Format

weight: 41

---

:TOC:

.Summary An introduction to the s-expression file format.

<!--more-->

== Introduction

KiCad uses an s-expression file format for symbol libraries, footprint libraries, schematics, printed circuit boards, and title block and border worksheets.

=== Syntax

- \* Syntax is based on the Specctra DSN file format.
- \* Token definitions are delimited by opening ``(`` and closing ``)`` parenthesis.
- \* All tokens are lowercase.
- \* Tokens cannot contain any white space characters or special characters other than the underscore `\_` character.
- \* All strings are quoted using the double quote character (`"`) and are UTF-8 encoded.
- \* Tokens can have zero or more attributes.
- \* Human readability is a design goal.

=== Conventions

In order to use the file format documentation properly, there are a few notation conventions that must be understood.

- \* Token attributes are upper case descriptive names. For example ``(at X Y)`, X is the

horizontal coordinate and Y is the vertical coordinate.

- \* Some tokens have a limited number of possible attribute values which are separated by a logical or character '|'. For example `(visible yes|no)` the only valid attributes for the `visible` token are `yes` or `no`.
- \* Some tokens have optional attributes which are enclosed in square braces. For example `(paper A0 [portrait])` the page portrait setting is optional.

### === Coordinates and Sizes

- \* All values are given in millimeters.
- \* Exponential floating point values are not used for readability purposes.
- \* All coordinates are relative to the origin of their containing object.

### == Common Syntax

This section defines all syntax that is shared across the symbol library, footprint library, schematic, board, and work sheet file formats.

### === Library Identifier

The xref:../sexpr-symbol-lib/index.adoc#\_introduction[schematic symbol library] and xref:../sexpr-footprint/index.adoc#\_introduction[printed circuit board footprint library] file formats use library identifiers. Library identifiers are defined as a quoted string using the "LIBRARY\_NICKNAME:ENTRY\_NAME" format where "LIBRARY\_NICKNAME" is the nickname of the library in the symbol or footprint library table and "ENTRY\_NAME" is the name of the symbol or footprint in the library separated by a colon.

NOTE: The "LIBRARY\_NICKNAME" is not stored in the library files because a library cannot know what the assigned library table nickname is in advance. Only the "ENTRY\_NAME" is saved in the library files.

### === Position Identifier

The `at` token defines the positional coordinates and rotation of an object.

```\n(at

```

X                                     <1>
Y                                     <2>
[ANGLE]                             <3>
)
...

```

<1> The X attribute defines the horizontal position of the object.

<2> The Y attribute defines the vertical position of the object.

<3> The optional ANGLE attribute defines the rotational angle of the object. Not all objects have rotational position definitions.

NOTE: Symbol `text` ANGLES are stored in tenth's of a degree. All other ANGLES are stored in degrees.

=== Coordinate Point List

The `pts` token defines a list of X/Y coordinate points.

```

...

(pts
  (xy X Y)                             <1>
  ...
  (xy X Y)
)
...

```

<1> The `xy` token defines a single X and Y coordinate pair. The number of points is determined by the object type.

=== Stroke Definition

The `stroke` token defines how the outlines of graphical objects are drawn.

```

(stroke
  (width WIDTH)                <1>
  (type TYPE)                  <2>
  (color R G B A)              <3>
)
...

```

<1> The ``width`` token attribute defines the line width of the graphic object.

<2> The ``type`` token attribute defines the line style of the graphic object. Valid stroke line styles are:

```

* `dash`
* `dash_dot`
* `dash_dot_dot` (from version 7)
* `dot`
* `default`
* `solid`

```

<3> The ``color`` token attributes define the line red, green, blue, and alpha color settings.

=== Text Effects

All text objects can have an optional ``effects`` section that defines how the text is displayed.

```

...

(effects
  (font                <1>
    [(face FACE_NAME)] <2>
    (size HEIGHT WIDTH) <3>
    [(thickness THICKNESS)] <4>
    [bold]              <5>
    [italic]            <6>
    [(line_spacing LINE_SPACING)] <7>
  )
  [(justify [left | right] [top | bottom] [mirror])] <8><9>
  [hide]          <10>
)

```

```
)  
...
```

- <1> The ``font`` token attributes define how the text is shown.
- <2> The optional ``face`` token indicates the font family. It should be a TrueType font family name or "KiCad Font" for the KiCad stroke font. (from version 7)
- <3> The ``size`` token attributes define the font height and width.
- <4> The ``thickness`` token attribute defines the line thickness of the font.
- <5> The ``bold`` token specifies if the font should be bold.
- <6> The ``italic`` token specifies if the font should be italicized.
- <7> The ``line_spacing`` token specifies the spacing between lines as a ratio of standard line-spacing.
(Not yet supported)
- <8> The optional ``justify`` token attributes define if the text is justified horizontally ``right`` or ``left`` and/or vertically ``top`` or ``bottom`` and/or mirrored. If the justification is not defined, then the text is center justified both horizontally and vertically and not mirrored.
- <9> The ``mirror`` token is only supported in the PCB Editor and Footprints.
- <10> The optional ``hide`` token defines if the text is hidden.

=== Page Settings

The ``paper`` token defines the drawing page size and orientation.

```
...
```

```
(paper  
  PAPER_SIZE | WIDTH HEIGHT          <1>  
  [portrait]                          <2>  
)  
...
```

- <1> Valid pages sizes are A0, A1, A2, A3, A4, A5, A, B, C, D, and E or the WIDTH and HEIGHT attributes are used for custom user defined page sizes.
 - <2> The ``portrait`` token defines if the page is shown in the portrait mode. If not defined, the landscape page layout mode is used.
- === Title Block

The `title\_block` token defines the contents of the title block.

...

```
(title_block
  (title "TITLE")                                <1>
  (date "DATE")                                  <2>
  (rev "REVISION")                              <3>
  (company "COMPANY_NAME")                      <4>
  (comment N "COMMENT")                         <5>
)
```

...

<1> The `title` token attribute is a quoted string that defines the document title.

<2> The `date` token attribute is a quoted string that defines the document date using the YYYY-MM-DD format.

<3> The `rev` token attribute is a quoted string that defines the document revision.

<4> The `company` token attribute is a quoted string that defines the document company name.

<5> The `comment` token attributes define the document comments where N is a number from 1 to 9 and COMMENT is a quoted string.

=== Properties

The `property` token defines a key value pair for storing user defined information.

...

```
(property
  "KEY"                                           <1>
  "VALUE"                                         <2>
)
```

...

<1> The property key attribute is a string that defines the name of the property. Property keys must be unique.

<2> The property value attribute is a string associated with the key attribute.

=== Universally Unique Identifier

The ``uuid`` token defines an universally unique identifier.

```
...  
  
(uuid  
  UUID                                <1><2>  
)  
...
```

<1> The UUID attribute is a Version 4 (random) UUID that should be globally unique. KiCad UUIDs are generated using the https://en.wikipedia.org/wiki/Mersenne_Twister[mt19937 Mersenne Twister] algorithm.

<2> Files converted from legacy versions of KiCad (prior to 6.0) have their locally-unique timestamps re-encoded in UUID format.

=== Images

The ``image`` token defines an embedded image. This section will not exist if no images are present.

```
...  
  
(image  
  POSITION_IDENTIFIER                <1>  
  [(scale SCALAR)]                 <2>  
  [(layer LAYER_DEFINITIONS)]      <3>  
  UNIQUE_IDENTIFIER                <4>  
  (data IMAGE_DATA)                <5>  
)  
...
```

<1> The POSITION_IDENTIFIER defines the

xref:../sexpr-intro/index.adoc#_position_identifier[X and Y coordinates] of the image.

- <2> The optional ``scale`` token attribute defines the `SCALE_FACTOR` of the image.
- <3> The ``layer`` token attribute defines the associated board layer of the image using one
`<<_canonical_layer_names,canonical layer name>>`.
Only used by board and footprint images.
- <4> The `UNIQUE_IDENTIFIER` defines the
`xref:../sexpr-intro/index.adoc#_universally_unique_identifier[universally unique identifier]`
for the image.
- <5> The ``data`` token attribute defines the image data in the
`https://en.wikipedia.org/wiki/Portable_Network_Graphics[portable network graphics format (PNG)]`
encoded with `https://en.wikipedia.org/wiki/Base64#MIME[MIME type base64]`.

== Board Common Syntax

This section defines all syntax that is shared across the footprint library and printed circuit board file formats.

== Board Coordinates

- * The minimum internal unit for printed circuit board and footprint files is one nanometer so there is maximum resolution of six decimal places or 0.000001 mm. Any precision beyond six places will be truncated.

== Layers

All drawable board and footprint objects exist on a ``layer`` which is defined in the drawable item definition. All layers can be renamed by the user.

NOTE: Internally, all layer names are canonical. User defined layer names are only used for display and output purposes.

```
...  
(layer
```

```

    LAYER_DEFINITION                                <1>
)
...

```

<1> Layer definitions can be specified as a list of one or more

<<_canonical_layer_names,canonical layer names>> or with a '*' wildcard to represent all layers that match the rest of the wildcard. For instance, `pass:[\*].Cu` represents all of the copper layers. This only applies to
 <<_canonical_layer_names, canonical layers names>>.

=== Capacity

- * 60 total layers.
- * 32 copper layers.
- * 8 paired technical layers for silk screen, solder mask, solder paste, and adhesive.
- * 4 user pre-defined layers for drawings, engineering change order (ECO), and comments.
- * 1 layer to define the board outline.
- * 1 layer to define the board margins.
- * 9 optional user definable layers.

=== Canonical Layer Names

The table below list all of the canonical layer names used in the file format.

[options="header"]

|=====

|Canonical Name | Description

|F.Cu | Front copper layer

|In1.Cu | Inner copper layer 1

|In2.Cu | Inner copper layer 2

|In3.Cu | Inner copper layer 3

|In4.Cu | Inner copper layer 4

|In5.Cu | Inner copper layer 5

|In6.Cu | Inner copper layer 6

|In7.Cu | Inner copper layer 7

|In8.Cu | Inner copper layer 8

|In9.Cu | Inner copper layer 9
|In10.Cu | Inner copper layer 10
|In11.Cu | Inner copper layer 11
|In12.Cu | Inner copper layer 12
|In13.Cu | Inner copper layer 13
|In14.Cu | Inner copper layer 14
|In15.Cu | Inner copper layer 15
|In16.Cu | Inner copper layer 16
|In17.Cu | Inner copper layer 17
|In18.Cu | Inner copper layer 18
|In19.Cu | Inner copper layer 19
|In20.Cu | Inner copper layer 20
|In21.Cu | Inner copper layer 21
|In22.Cu | Inner copper layer 22
|In23.Cu | Inner copper layer 23
|In24.Cu | Inner copper layer 24
|In25.Cu | Inner copper layer 25
|In26.Cu | Inner copper layer 26
|In27.Cu | Inner copper layer 27
|In28.Cu | Inner copper layer 28
|In29.Cu | Inner copper layer 29
|In30.Cu | Inner copper layer 30
|B.Cu | Back copper layer
|B.Adhes | Back adhesive layer
|F.Adhes | Front adhesive layer
|B.Paste | Back solder paste layer
|F.Paste| Front solder paste layer
|B.SilkS | Back silk screen layer
|F.SilkS | Front silk screen layer
|B.Mask | Back solder mask layer
|F.Mask | Front solder mask layer
|Dwgs.User | User drawing layer
|Cmts.User | User comment layer
|Eco1.User | User engineering change order layer 1
|Eco2.User | User engineering change order layer 2

```

|Edge.Cuts | Board outline layer
|F.CrtYd | Footprint front courtyard layer
|B.CrtYd | Footprint back courtyard layer
|F.Fab | Footprint front fabrication layer
|B.Fab | Footprint back fabrication layer
|User.1 | User definable layer 1
|User.2 | User definable layer 2
|User.3 | User definable layer 3
|User.4 | User definable layer 4
|User.5 | User definable layer 5
|User.6 | User definable layer 6
|User.7 | User definable layer 7
|User.8 | User definable layer 8
|User.9 | User definable layer 9
|=====

```

=== Footprint

The `footprint` token defines a footprint.

NOTE: Prior to version 6, the `footprint` token was referred to as `module`.

...

```

(footprint
  ["LIBRARY_LINK"] <1>
  [locked] <2>
  [placed] <3>
  (layer LAYER_DEFINITIONS) <4>
  (tedit TIME_STAMP) <5>
  [(uuid UUID)] <6>
  [POSITION_IDENTIFIER] <7>
  [(descr "DESCRIPTION")] <8>
  [(tags "NAME")] <9>
  [(property "KEY" "VALUE") ...] <10>

```

| | |
|--|------|
| (path "PATH") | <11> |
| [(autoplacement_cost90 COST)] | <12> |
| [(autoplacement_cost180 COST)] | <13> |
| [(solder_mask_margin MARGIN)] | <14> |
| [(solder_paste_margin MARGIN)] | <15> |
| [(solder_paste_ratio RATIO)] | <16> |
| [(clearance CLEARANCE)] | <17> |
| [(zone_connect CONNECTION_TYPE)] | <18> |
| [(thermal_width WIDTH)] | <19> |
| [(thermal_gap DISTANCE)] | <20> |
| [ATTRIBUTES] | <21> |
| [(private_layers LAYER_DEFINITIONS)] | <22> |
| [(net_tie_pad_groups PAD_GROUP_DEFINITIONS)] | <23> |
| GRAPHIC_ITEMS... | <24> |
| PADS... | <25> |
| ZONES... | <26> |
| GROUPS... | <27> |
| 3D_MODEL | <28> |

)

...

- <1> The "LIBRARY_LINK" attribute defines the link to footprint library of the footprint. This only applies to footprints defined in the board file format.
- <2> The optional `locked` token defines a flag to indicate the footprint cannot be edited.
- <3> The optional `placed` token defines a flag to indicate that the footprint has not been placed.
- <4> The `layer` token defines the <<canonical_layer_names, canonical layer>> the footprint is placed.
- <5> The `tedit` token defines a the last time the footprint was edited.
- <6> The `uuid` token defines the unique identifier for the footprint. This only applies to footprints defined in the board file format.
- <7> The <<position_identifier, POSITION_IDENTIFIER>> defines the X and Y coordinates and rotational angle of the footprint. This only applies to footprints defined in the board file format.
- <8> The optional `tags` token defines a string of search tags for the footprint.
- <9> The optional `descr` token defines a string containing the description of the footprint.
- <10> The optional `property` token defines a property for the footprint.

- <11> The ``path`` token defines the hierarchical path of the schematic symbol linked to the footprint. This only applies to footprints defined in the board file format.
- <12> The optional ``autoplace_cost90`` token defines the vertical cost of when using the automatic footprint placement tool. Valid values are integers 1 through 10. This only applies to footprints defined in the board file format.
- <13> The optional ``autoplace_cost180`` token defines the horizontal cost of when using the automatic footprint placement tool. Valid values are integers 1 through 10. This only applies to footprints defined in the board file format.
- <14> The optional ``solder_mask_margin`` token defines the solder mask distance from all pads in the footprint. If not set, the board ``solder_mask_margin`` setting is used.
- <15> The optional ``solder_paste_margin`` token defines the solder paste distance from all pads in the footprint. If not set, the board ``solder_paste_margin`` setting is used.
- <16> The optional ``solder_paste_ratio`` token defines the percentage of the pad size used to define the solder paste for all pads in the footprint. If not set, the board ``solder_paste_ratio`` setting is used.
- <17> The optional ``clearance`` token defines the clearance to all board copper objects for all pads in the footprint. If not set, the board ``clearance`` setting is used.
- <18> The optional ``zone_connect`` token defines how all pads are connected to filled zone. If not defined, then the zone ``connect_pads`` setting is used. Valid connection types are integers values from 0 to 3 which defines:
- * 0 - Pads are not connect to zone.
 - * 1 - Pads are connected to zone using thermal reliefs.
 - * 2 - Pads are connected to zone using solid fill.
- <19> The optional ``thermal_width`` token defined the thermal relief spoke width used for zone connections for all pads in the footprint. This only affects pads connected to zones with thermal reliefs. If not set, the zone ``thermal_width`` setting is used.
- <20> The optional ``thermal_gap`` is the distance from the pad to the zone of thermal relief connections for all pads in the footprint. If not set, the zone ``thermal_gap`` setting is used. If not set, the zone ``thermal_gap`` setting is used.
- <21> The optional `<<_footprint_attributes,attributes section>>` defines the attributes of the footprint.
- <22> An optional list of `<<_canonical_layer_names, canonical layer names>>` which are private to the footprint.
- <23> An optional list of `<<_net_tie_pad_groups, net-tie pad groups>>`.
- <24> The graphic objects section is a list of one or more

<<_footprint_graphics_items, graphical objects>> in the footprint. At a minimum, the reference designator and value <<_footprint_text, text objects>> are defined. All other graphical objects are optional.

<25> The optional pads section is a list of <<_footprint_pad, pads>> in the footprint.

<26> The optional zones section is a list of
<<_zone, keep out zones>> in the footprint.

<27> The optional groups section is a list of <<_group, grouped objects>> in the footprint.

<28> The <<_footprint_3d_model, 3D model section>> defines the 3D model object associated with the footprint.

==== Footprint Attributes

Footprint `attr` token defines the list of attributes of the footprint.

```
...
(attr
    TYPE                                <1>
    [board_only]                        <2>
    [exclude_from_pos_files]            <3>
    [exclude_from_bom]                  <4>
)
...
```

<1> The TYPE token defines the type of footprint. Valid footprint types are `smd` and `through\_hole`.

<2> The optional `board\_only` token indicates that the footprint is only defined in the board and has no reference to any schematic symbol.

<3> The optional `exclude\_from\_pos\_files` token indicates that the footprint position information should not be included when creating position files.

<4> The optional `exclude\_from\_bom` token indicates that the footprint should be excluded when creating bill of materials (BOM) files.

==== Net-tie Pad Groups

A space-separated list of quoted strings, each containing a comma-separated list of pad names.

Nets attached to pads within a single pad-group are allowed to short.

==== Footprint Graphics Items

Footprint graphical items define all of the drawing items that are used in the <<_footprint,footprint definition>>. This includes <<_footprint_text,text>>, <<_footprint_text_box,text boxes>>, <<_footprint_line,lines>>, <<_footprint_rectangle,rectangles>>, <<_footprint_circle,circles>>, <<_footprint_arc,arcs>>, <<_footprint_polygon,polygons>>, <<_footprint_curve,curves>>, and <<_dimension,dimensions>>.

NOTE: Footprint graphic items starting with `fp\_` are not valid outside of a footprint definition.

==== Footprint Images

See the <<_images,images>> section. This section will not exist if there are no images on the footprint. Footprint images are not displayed on the PCB when a footprint is placed, only in the footprint editor.

===== Footprint Text

The `fp\_text` token defines text in a <<_footprint,footprint definition>>.

...

```
(fp_text
  TYPE                                <1>
  "TEXT"                             <2>
  POSITION_IDENTIFIER                  <3>
  [unlocked]                         <4>
  (layer LAYER_DEFINITION)           <5>
  [hide]                             <6>
  (effects TEXT_EFFECTS)             <7>
  (uuid UUID)                        <8>
)
```

...

<1> The TYPE attribute defines the type of text. Valid types are `reference`, `value`, and `user`.

- <2> The "TEXT" attribute is a quoted string that defines the text.
- <3> The <<_position_identifier, POSITION_IDENTIFIER>> defines the X and Y position coordinates and optional orientation angle of the text.
- <4> The optional `unlocked` token indicates if the text orientation can be anything other than the upright orientation.
- <5> The `layer` token defines the <<_canonical_layer_names, canonical layer>> the text resides on.
- <6> The optional [hide] token, defines if the text is hidden.
- <7> The `effects` token defines how the <<_text_effects, text is displayed>>.
- <8> The `uuid` token defines the unique identifier of the text object.

==== Footprint Text Box

(from version 7)

The `fp\_text\_box` token defines a rectangle containing line-wrapped text.

...

```
(fp_text_box
  [locked]                                <1>
  "TEXT"                                  <2>
  [(start X Y)]                           <3>
  [(end X Y)]                             <4>
  [(pts (xy X Y) (xy X Y) (xy X Y) (xy X Y))] <5>
  [(angle ROTATION)]                      <6>
  (layer LAYER_DEFINITION)                <7>
  (uuid UUID)                             <8>
  TEXT_EFFECTS                            <9>
  [STROKE_DEFINITION]                     <10>
  [(render_cache RENDER_CACHE)]           <11>
)
```

...

- <1> The optional `locked` token specifies if the text box can be moved.
- <2> The content of the text box
- <3> The `start` token defines the top-left of a cardinally oriented text box.

- <4> The ``end`` token defines the bottom-right of a cardinally oriented text box.
- <5> The ``pts`` token defines the four corners of a non-cardianlly oriented text box. The corners must be in order, but the winding can be either direction.
- <6> The optional ``angle`` token defines the rotation of the text box in degrees.
- <7> The ``layer`` token defines the <<_canonical_layer_names, canonical layer>> the text box resides on.
- <8> The ``uuid`` token defines the unique identifier of the text box.
- <9> The <<_text_effects, TEXT_EFFECTS>> describe the style of the text in the text box.
- <10> The <<_stroke_definition, STROKE_DEFINITION>> describes the style of an optional border to be drawn around the text box.
- <11> If the ``TEXT_EFFECTS`` prescribe a TrueType font then a render cache should be given in case the font can not be found on the current system.

NOTE: If ``angle`` is not given, or is a cardinal angle (0, 90, 180 or 270), then the text box MUST have ``start`` and ``end`` tokens.

NOTE: If ``angle`` is given and is not a cardinal angle, then the text box MUST have a ``pts`` token (with 4 pts).

==== Footprint Line

The ``fp_line`` token defines a graphic line in a <<_footprint, footprint definition>>.

...

```

(fp_line
  (start X Y)                                <1>
  (end X Y)                                  <2>
  (layer LAYER_DEFINITION)                   <3>
(width WIDTH)                                <4>
  STROKE_DEFINITION                           <5>
  [(locked)]                                 <6>
  (uuid UUID)                                <7>
)

```

...

- <1> The `start` token defines the coordinates of the beginning of the line.
- <2> The `end` token defines the coordinates of the end of the line.
- <3> The `layer` token defines the <<canonical_layer_names, canonical layer>> the line resides on.
- <4> The `width` token defines the line width. (prior to version 7)
- <5> The <<stroke_definition, STROKE_DEFINITION>> describes the width and style of the line.
(from version 7)
- <6> The optional `locked` token defines if the line cannot be edited.
- <7> The `uuid` token defines the unique identifier of the line object.

==== Footprint Rectangle

The `fp\_rect` token defines a graphic rectangle in a <<footprint, footprint definition>>.

...

```
(fp_rect
  (start X Y)                                <1>
  (end X Y)                                  <2>
  (layer LAYER_DEFINITION)                   <3>
  (width WIDTH)                             <4>
  STROKE_DEFINITION                          <5>
  [(fill yes | no)]                          <6>
  [(locked)]                                <7>
  (uuid UUID)                               <8>
)
```

...

- <1> The `start` token defines the coordinates of the upper left corner of the rectangle.
- <2> The `end` token defines the coordinates of the low right corner of the rectangle.
- <3> The `layer` token defines the <<canonical_layer_names, canonical layer>> the rectangle resides on.
- <4> The `width` token defines the line width of the rectangle. (prior to version 7)
- <5> The <<stroke_definition, STROKE_DEFINITION>> describes the line width and style of the rectangle. (from version 7)
- <6> The optional `fill` token defines if the rectangle is filled. If not defined, the rectangle

is not filled.

<7> The optional `locked` token defines if the rectangle cannot be edited.

<8> The `uuid` token defines the unique identifier of the rectangle object.

==== Footprint Circle

The `fp\_circle` token defines a graphic circle in a <<_footprint, footprint definition>>.

...

```
(fp_circle
  (center X Y)                <1>
  (end X Y)                   <2>
  (layer LAYER_DEFINITION)    <3>
  (width WIDTH)               <4>
  STROKE_DEFINITION            <5>
  [(fill yes | no)]           <6>
  [(locked)]                   <7>
  (uuid UUID)                 <8>
)
```

...

<1> The `center` token defines the coordinates of the center of the circle.

<2> The `end` token defines the coordinates of the end of the radius of the circle.

<3> The `layer` token defines the <<_canonical_layer_names, canonical layer>> the circle resides on.

<4> The `width` token defines the line width of the circle. (prior to version 7)

<5> The <<_stroke_definition, STROKE_DEFINITION>> describes the line width and style of the circle.
(from version 7)

<6> The optional `fill` token defines if the circle is filled. If not defined, the circle is not filled.

<7> The optional `locked` token defines if the circle cannot be edited.

<8> The `uuid` token defines the unique identifier of the circle object.

==== Footprint Arc

The `fp\_arc` token defines a graphic arc in a <<_footprint, footprint definition>>.

...

```

(fp_arc
  (start X Y) <1>
  (mid X Y) <2>
  (end X Y) <3>
  (layer LAYER_DEFINITION) <4>
  (width WIDTH) <5>
  STROKE_DEFINITION <6>
  [(locked)] <7>
  (uuid UUID) <8>
)
...

```

<1> The `start` token defines the coordinates of the start position of the arc radius.

<2> The `mid` token defines the coordinates of the midpoint along the arc.

<3> The `end` token defines the coordinates of the end position of the arc radius.

<4> The `layer` token defines the <<_canonical_layer_names, canonical layer>> the arc resides on.

<5> The `width` token defines the line width of the arc. (prior to version 7)

<6> The <<_stroke_definition, STROKE_DEFINITION>> describes the line width and style of the arc.

(from version 7)

<7> The optional `locked` token defines if the arc cannot be edited.

<8> The `uuid` token defines the unique identifier of the arc object.

==== Footprint Polygon

The `fp\_poly` token defines a graphic polygon in a <<_footprint, footprint definition>>.

```

...

(fp_poly
  COORDINATE_POINT_LIST <1>
  (layer LAYER_DEFINITION) <2>
  (width WIDTH) <3>
  STROKE_DEFINITION <4>
  [(fill yes | no)] <5>
  [(locked)] <6>
  (uuid UUID) <7>
)

```

```
)  
...  

```

<1> The COORDINATE_POINT_LIST defines the list of

<<_coordinate_point_list, X/Y coordinates>> of the polygon outline.

<2> The `layer` token defines the <<_canonical_layer_names,canonical layer>> the polygon resides on.

<3> The `width` token defines the line width of the polygon. (prior to version 7)

<4> The <<_stroke_definition, STROKE_DEFINITION>> describes the line width and style of the polygon.
(from version 7)

<5> The optional `fill` token defines if the polygon is filled. If not defined, the polygon is not filled.

<6> The optional `locked` token defines if the polygon cannot be edited.

<7> The `uuid` token defines the unique identifier of the polygon object.

===== Footprint Curve

The `fp\_curve` token defines a graphic

https://en.wikipedia.org/wiki/B%C3%A9zier_curve#Quadratic_B%C3%A9zier_curves[Cubic Bezier curve]

in a <<_footprint,footprint definition>>.

```
...  

```

```
(fp_curve
```

```
    COORDINATE_POINT_LIST                                <1>
```

```
    (layer LAYER_DEFINITION)                             <2>
```

```
    (width WIDTH)                                         <3>
```

```
    STROKE_DEFINITION                                    <4>
```

```
    [(locked)]                                           <5>
```

```
    (uuid UUID)                                          <6>
```

```
)  

```

```
...  

```

<1> The COORDINATE_POINT_LIST defines the four

<<_coordinate_point_list, X/Y coordinates>> of each point of the curve.

<2> The `layer` token defines the <<_canonical_layer_names, canonical layer>> the curve resides on.

- <3> The `width` token defines the line width of the curve. (prior to version 7)
- <4> The <<_stroke_definition, STROKE_DEFINITION>> describes the line width and style of the curve.
(from version 7)
- <5> The optional `locked` token defines if the curve cannot be edited.
- <6> The `uuid` token defines the unique identifier of the curve object.

==== Footprint Pad

The `pad` token defines a pad in a <<_footprint, footprint definition>>.

...

```
(pad
  "NUMBER"                                <1>
  TYPE                                    <2>
  SHAPE                                  <3>
  POSITION_IDENTIFIER                      <4>
  [(locked)]                             <5>
  (size X Y)                             <6>
  [(drill DRILL_DEFINITION)]             <7>
  (layers "CANONICAL_LAYER_LIST")        <8>
  [(property PROPERTY)]                  <9>
  [(remove_unused_layer)]                 <10>
  [(keep_end_layers)]                    <11>
  [(roundrect_rratio RATIO)]             <12>
  [(chamfer_ratio RATIO)]                 <13>
  [(chamfer CORNER_LIST)]                <14>
  (net NUMBER "NAME")                    <15>
  (uuid UUID)                            <16>
  [(pinfunction "PIN_FUNCTION")]          <17>
  [(pintype "PIN_TYPE")]                  <18>
  [(die_length LENGTH)]                  <19>
  [(solder_mask_margin MARGIN)]           <20>
  [(solder_paste_margin MARGIN)]          <21>
  [(solder_paste_margin_ratio RATIO)]     <22>
  [(clearance CLEARANCE)]                <23>
```

```

        [(zone_connect ZONE)]                                <24>
        [(thermal_width WIDTH)]                              <25>
        [(thermal_gap DISTANCE)]                             <26>
        [CUSTOM_PAD_OPTIONS]                                  <27>
        [CUSTOM_PAD_PRIMITIVES]                              <28>
    )
    ...

```

- <1> The "NUMBER" attribute is the pad number.
- <2> The pad TYPE can be defined as `thru\_hole`, `smd`, `connect`, or `np\_thru\_hole`.
- <3> The pad SHAPE can be defined as `circle`, `rect`, `oval`, `trapezoid`, `roundrect`, or `custom`.
- <4> The POSITION_IDENTIFIER defines the
 <<_position_identifer,X and Y coordinates and optional orientation angle>> of the pad.
- <5> The optional `locked` token defines if the footprint pad can be edited.
- <6> The `size` token defines the width and height of the pad.
- <7> The optional <<_pad_drill_definition,pad DRILL_DEFINITION>> defines the pad drill requirements.
- <8> The `layers` token defines the <<_layers,layer or layers>> the pad reside on.
- <9> The optional `property` token defines any special properties for the pad. Valid properties are
 `pad\_prop\_bga`, `pad\_prop\_fiducial\_glob`, `pad\_prop\_fiducial\_loc`, `pad\_prop\_testpoint`,
 `pad\_prop\_heatsink`, `pad\_prop\_heatsink`, and `pad\_prop\_castellated`.
- <10> The optional `remove\_unused\_layer` token specifies that the copper should be removed from any layers the pad is not connected to.
- <11> The optional `keep\_end\_layers` token specifies that the top and bottom layers should be retained when removing the copper from unused layers.
- <12> The optional `roundrect\_rratio` token defines the scaling factor of the pad to corner radius for rounded rectangular and chamfered corner rectangular pads. The scaling factor is a number between 0 and 1.
- <13> The optional `chamfer\_ratio` token defines the scaling factor of the pad to chamfer size. The scaling factor is a number between 0 and 1.
- <14> The optional `chamfer` token defines a list of one or more rectangular pad corners that get chamfered. Valid chamfer corner attributes are `top\_left`, `top\_right`, `bottom\_left`, and `bottom\_right`.
- <15> The optional `net` token defines the integer number and name string of the net connection for the pad.

- <16> The ``uuid`` token defines the unique identifier of the pad object.
- <17> The optional ``pinfunction`` token attribute defines the associated schematic symbol pin name.
- <18> The optional ``pintype`` token attribute defines the associated schematic pin electrical type.
- <19> The optional ``die_length`` token attribute defines the die length between the component pad and physical chip inside the component package.
- <20> The optional ``solder_mask_margin`` token attribute defines the distance between the pad and the solder mask for the pad. If not set, the footprint ``solder_mask_margin`` is used.
- <21> The optional ``solder_paste_margin`` token attribute defines the distance the solder paste should be changed for the pad.
- <22> The optional ``solder_paste_margin_ratio`` token attribute defines the percentage to reduce the pad outline by to generate the solder paste size.
- <23> The optional ``clearance`` token attribute defines the clearance from all copper to the pad. If not set, the footprint ``clearance`` is used.
- <24> The optional ``zone_connection`` token attribute defines type of zone connect for the pad. If not defined, the footprint ``zone_connection`` setting is used. Valid connection types are integers values from 0 to 3 which defines:
- * 0 - Pad is not connect to zone.
 - * 1 - Pad is connected to zone using thermal relief.
 - * 2 - Pad is connected to zone using solid fill.
- <25> The optional ``thermal_width`` token attribute defines the thermal relief spoke width used for zone connection for the pad. This only affects a pad connected to a zone with a thermal relief. If not set, the footprint ``thermal_width`` setting is used.
- <26> The optional ``thermal_gap`` token attribute defines the distance from the pad to the zone of the thermal relief connection for the pad. This only affects a pad connected to a zone with a thermal relief. If not set, the footprint ``thermal_gap`` setting is used.
- <27> The optional `<<_custom_pad_options,custom pad options>>` defines the options when a custom pad is defined.
- <28> The optional `<<_custom_pad_primitives,custom pad primitives>>` defines the drawing objects and options used to define a custom pad.

==== Pad Drill Definition

The ``drill`` token defines the drill attributes for a `<<_footprint_pad,footprint pad>>`.

...

```

(drill
  [oval] <1>
  DIAMETER <2>
  [WIDTH] <3>
  [(offset X Y)] <4>
)
...

```

<1> The optional `oval` token defines if the drill is oval instead of round.

<2> The diameter attribute defines the drill diameter.

<3> The optional width attribute defines the width of the slot for oval drills.

<4> The optional `offset` token defines the drill offset coordinates from the center of the pad.

==== Custom Pad Options

The optional `options` token attributes define the settings used for custom pads. This token is only used when a <<_footprint_pad,custom pad>> is defined.

```

...
(options
  (clearance CLEARANCE_TYPE) <1>
  (anchor PAD_SHAPE) <2>
)
...

```

<1> The `clearance` token defines the type of clearance used for a custom pad. Valid clearance types are `outline` and `convexhull`.

<2> The `anchor` token defines the anchor pad shape of a custom pad. Valid anchor pad shapes are `rect` and `circle`.

==== Custom Pad Primitives

The optional `primitives` token defines a list of graphical items used to define the outline of a custom pad shape. This token is only used when a <<_footprint_pad,custom pad>> is defined.

...

```
(primitives
  GRAPHIC_ITEMS... <1>
  (width WIDTH) <2>
  [(fill yes)] <3>
)
```

...

- <1> The graphical items is a list of graphical <<_graphical_line,lines>>, <<_graphical_rectangle,rectangles>>, <<_graphical_arc,arcs>>, <<_graphical_circle,circles>>, <<_graphical_curve,curves>>, <<_graphical_polygon,polygons>>, and <<_annotation_bounding_box,annotation bounding boxes>> that define the shape of the custom pad (annotation bounding boxes from version 7). The item definitions only include the geometrical information that defines the item. The annotation bounding box defines the location (and size) of the pad number and netname.
- <2> The `width` token defines the line width of the <<_graphical_items_section,graphical items>>.
- <3> The optional `fill` token attribute `yes` indicates the geometry defined by the <<_graphical_items_section,graphical items>> should be filled.

==== Footprint 3D Model

The `model` token defines the 3D model associated with a <<_footprint,footprint>>.

...

```
(model
  "3D_MODEL_FILE" <1>
  (at (xyz X Y Z)) <2>
  (scale (xyz X Y Z)) <3>
  (rotate (xyz X Y Z)) <4>
)
```

...

- <1> The 3D_MODEL_FILE attribute is the path and file name of the 3D model.
- <2> The `at` token specifies the 3D position coordinates of the model relative to the footprint.
- <3> The `scale` token specifies the model scale factor for each 3D axis.

<4> The `rotate` token specifies the model rotation for each 3D axis relative to the footprint.

=== Graphic Items

The graphical items are footprint and board items that are outside of the connectivity items. This includes graphical items on technical, user, and copper layers. Graphical items are also used to define complex <<_footprint_pad,pad>> geometries.

==== Graphical Text

The `gr\_text` token defines graphical text.

```
...  
  
(gr_text  
  "TEXT"                                <1>  
  POSITION_IDENTIFIER                    <2>  
  (layer LAYER_DEFINITION [knockout])    <3>  
  (uuid UUID)                           <4>  
  (effects TEXT_EFFECTS)                 <5>  
)  
...
```

<1> The "TEXT" attribute is a quoted string that defines the text.

<2> The POSITION_IDENTIFER defines the

<<_position_identifier,X and Y coordinates and optional orientation angle>> of the text.

<3> The `layer` token defines the <<_canonical_layer_names, canonical layer>> the text resides on.

It is optionally followed by a `knockout` token indicating the text should be knocked out.

<4> The `uuid` token defines the unique identifier of the text object.

<5> The TEXT_EFFECTS defines how the <<_text_effects,text is displayed>>.

=== Graphical Text Box

(from version 7)

The `gr\_text\_box` token defines a rectangle containing line-wrapped text.

...

```
(gr_text_box
  [locked] <1>
  "TEXT" <2>
  [(start X Y)] <3>
  [(end X Y)] <4>
  [(pts (xy X Y) (xy X Y) (xy X Y) (xy X Y))] <5>
  [(angle ROTATION)] <6>
  (layer LAYER_DEFINITION) <7>
  (uuid UUID) <8>
  TEXT_EFFECTS <9>
  [STROKE_DEFINITION] <10>
  [(render_cache RENDER_CACHE)] <11>
)
```

...

<1> The optional `locked` token specifies if the text box can be moved.

<2> The content of the text box

<3> The `start` token defines the top-left of a cardinally oriented text box.

<4> The `end` token defines the bottom-right of a cardinally oriented text box.

<5> The `pts` token defines the four corners of a non-cardianlly oriented text box. The corners must be in order, but the winding can be either direction.

<6> The optional `angle` token defines the rotation of the text box in degrees.

<7> The `layer` token defines the <<_canonical_layer_names, canonical layer>> the text box resides on.

<8> The `uuid` token defines the unique identifier of the text box.

<9> The <<_text_effects, TEXT_EFFECTS>> describe the style of the text in the text box.

<10> The <<_stroke_definition, STROKE_DEFINITION>> describes the style of an optional border to be drawn around the text box.

<11> If the `TEXT\_EFFECTS` prescribe a TrueType font then a render cache should be given in case the font can not be found on the current system.

NOTE: If `angle` is not given, or is a cardinal angle (0, 90, 180 or 270), then the text box MUST have `start` and `end` tokens.

NOTE: If `angle` is given and is not a cardinal angle, then the text box MUST have a `pts` token

(with 4 pts).

==== Graphical Line

The ``gr_line`` token defines a graphical line.

...

```
(gr_line
  (start X Y)                <1>
  (end X Y)                  <2>
  [(angle ANGLE)]            <3>
  (layer LAYER_DEFINITION)   <4>
  (width WIDTH)              <5>
  (uuid UUID)                <6>
)
```

...

<1> The ``start`` token defines the coordinates of the beginning of the line.

<2> The ``end`` token defines the coordinates of the end of the line.

<3> The optional ``angle`` token defines the rotational angle of the line.

<4> The ``layer`` token defines the <<_canonical_layer_names, canonical layer>> the line resides on.

<5> The ``width`` token defines the line width.

<6> The ``uuid`` token defines the unique identifier of the line object.

==== Graphical Rectangle

The ``gr_rect`` token defines a graphical rectangle.

...

```
(gr_rect
  (start X Y)                <1>
  (end X Y)                  <2>
  (layer LAYER_DEFINITION)   <3>
  (width WIDTH)              <4>
```

```

    [(fill yes | no]]                <5>
    (uuid UUID)                      <6>
)
...

```

- <1> The ``start`` token defines the coordinates of the upper left corner of the rectangle.
- <2> The ``end`` token defines the coordinates of the low right corner of the rectangle.
- <3> The ``layer`` token defines the <<_canonical_layer_names, canonical layer>> the rectangle resides on.
- <4> The ``width`` token defines the line width of the rectangle.
- <5> The optional ``fill`` token defines how the rectangle is filled. If not defined, the rectangle is not filled.
- <6> The ``uuid`` token defines the unique identifier of the rectangle object.

==== Graphical Circle

The ``gr_circle`` token defines a graphical circle.

```

...

(gr_circle
  (center X Y)                      <1>
  (end X Y)                         <2>
  (layer LAYER_DEFINITION)         <3>
  (width WIDTH)                    <4>
  [(fill yes | no]]                <5>
  (uuid UUID)                      <6>
)
...

```

- <1> The ``center`` token defines the coordinates of the center of the circle.
- <2> The ``end`` token defines the coordinates of the end of the radius of the circle.
- <3> The ``layer`` token defines the <<_canonical_layer_names, canonical layer>> the circle resides on.
- <4> The ``width`` token defines the line width of the circle.
- <5> The optional ``fill`` token defines how the circle is filled. If not defined,

the circle is not filled.

<6> The `uuid` token defines the unique identifier of the circle object.

==== Graphical Arc

The `gr\_arc` token defines a graphical arc.

...

```
(gr_arc
  (start X Y)                <1>
  (mid X Y)                  <2>
  (end X Y)                  <3>
  (layer LAYER_DEFINITION)   <4>
  (width WIDTH)              <5>
  (uuid UUID)                <6>
)
```

...

<1> The `start` token defines the coordinates of the start position of the arc radius.

<2> The `mid` token defines the coordinates of the midpoint along the arc.

<3> The `end` token defines the coordinates of the end position of the arc radius.

<4> The `layer` token defines the <<_canonical_layer_names, canonical layer>> the arc resides on.

<5> The `width` token defines the line width of the arc.

<6> The `uuid` token defines the unique identifier of the arc object.

==== Graphical Polygon

The `gr\_poly` token defines a graphical polygon.

...

```
(gr_poly
  COORDINATE_POINT_LIST      <1>
  (layer LAYER_DEFINITION)    <2>
  (width WIDTH)               <3>
  [(fill yes | no)]           <4>
```

```

        (uuid UUID)                                <5>
    )
...

```

<1> The COORDINATE_POINT_LIST defines the list of

<<_coordinate_point_list, X/Y coordinates>> of the polygon outline.

<2> The `layer` token defines the <<_canonical_layer_names, canonical layer>> the polygon resides on.

<3> The `width` token defines the line width of the polygon.

<4> The optional `fill` token defines how the polygon is filled. If not defined, the polygon is not filled.

<5> The `uuid` token defines the unique identifier of the polygon object.

==== Graphical Curve

The `bezier` token defines a graphic

https://en.wikipedia.org/wiki/B%C3%A9zier_curve#Quadratic_B%C3%A9zier_curves[Cubic Bezier curve].

```

...
( bezier
    COORDINATE_POINT_LIST                                <1>
    ( layer LAYER_DEFINITION)                             <2>
    ( width WIDTH)                                         <3>
    ( uuid UUID)                                           <4>
)
...

```

<1> The COORDINATE_POINT_LIST defines the list of

<<_coordinate_point_list, X/Y coordinates>> of the four pointS of the curve.

<2> The `layer` token defines the <<_canonical_layer_names, canonical layer>> the curve resides on.

<3> The `width` token defines the line width of the curve.

<4> The `uuid` token defines the unique identifier of the curve object.

==== Annotation Bounding Box (from version 7)

The ``gr_bbox`` token defines a bounding box inside which annotations (such as pad numbers and netnames) will be shown.

```
...  
  
(gr_bbox  
  (start X Y)                <1>  
  (end X Y)                  <2>  
)  
...
```

<1> The ``start`` token defines the coordinates of the upper left corner of the rectangle.

<2> The ``end`` token defines the coordinates of the low right corner of the rectangle.

==== Dimension

The ``dimension`` token defines a dimension object.

```
...  
  
(dimension  
  [locked]                    <1>  
  (type DIMENSION_TYPE)      <2>  
  (layer LAYER_DEFINITION)    <3>  
  (uuid UUID)                 <4>  
  (pts (xy X Y) (xy X Y))     <5>  
  [(height HEIGHT)]           <6>  
  [(orientation ORIENTATION)] <7>  
  [(leader_length LEADER_LENGTH)] <8>  
  [(gr_text GRAPHICAL_TEXT)]  <9>  
  [(format DIMENSION_FORMAT)] <10>  
  (style DIMENSION_STYLE)     <11>  
)  
...
```

<1> The optional ``locked`` token specifies if the dimension can be moved.

<2> The ``type`` token attribute defines the type of dimension. Valid dimension types are

- `aligned`, `leader`, `center`, `orthogonal`, and `radial` (`radial` from version 7).
- <3> The `layer` token defines the xref:../sexpr-intro/index.adoc#_canonical_layer_names[canonical layer] the polygon resides on.
 - <4> The `uuid` token defines the unique identifier of the dimension object.
 - <5> The `pts` token attributes define the list of `xy` coordinates of the dimension.
 - <6> The optional `height` token attribute defines the height of aligned dimensions.
 - <7> The optional `orientation` token attribute defines the rotation angle for orthogonal dimensions.
 - <8> The optional `leader\_length` token attribute defines the distance from the marked radius to the knee for radial dimensions.
 - <9> The optional `gr\_text` token attributes define the dimension text formatting for all dimension types except center dimensions.
 - <10> The optional `format` token attributes define the <<_dimension_format,dimension formatting>> for all dimension types except center dimensions.
 - <11> The `style` token attributes define the <<_dimension_style,dimension style>> information.

==== Dimension Format

The `format` token attributes define the text formatting of the dimension.

...

```
(format
  [(prefix "PREFIX")]                <1>
  [(suffix "SUFFIX")]                <2>
  (units UNITS)                      <3>
  (units_format UNITS_FORMAT)        <4>
  (precision PRECISION)              <5>
  [(override_value "VALUE")]         <6>
  [(suppress_zeros yes | no)]        <7>
)
```

...

- <1> The optional `prefix` token attribute defines the string to add to the beginning of the dimension text.
- <2> The optional `suffix` token attribute defines the string to add to the end of the dimension

text.

<3> The `units` token attribute defines the dimension units used to display the dimension text.

Valid units are as follows:

- * 0 - Inches.
- * 1 - Mils.
- * 2 - Millimeters.
- * 3 - Automatic.

<4> The `units\_format` token attribute defines how the unit's suffix is formatted. Valid units formats are as follows:

- * 0 - No suffix.
- * 1 - Bare suffix.
- * 2 - Wrap suffix in parenthesis.

<5> The `precision` token attribute defines the number of significant digits to display. From version 7, a `precision` above 5 indicates a units-scaled precision:

- * 6 - 0.00 in / 0 mils / 0.0 mm
- * 7 - 0.000 in / 0 mils / 0.00 mm
- * 8 - 0.0000 in / 0.0 mils / 0.000mm
- * 9 - 0.00000 in / 0.00 mils / 0.0000mm

<6> The optional `override\_value` token attribute defines the text to substitute for the actual physical dimension.

<7> The optional `suppress\_zeros` token removes all trailing zeros from the dimension text.

The only valid attributes are `yes` and `no`.

==== Dimension Style

...

(style

(thickness THICKNESS) <1>

(arrow_length LENGTH) <2>

(text_position_mode MODE) <3>

[(arrow_direction DIRECTION)] <4>

[(extension_height HEIGHT)] <5>

[(text_frame TEXT_FRAME_TYPE)] <6>

[(extension_offset OFFSET)] <7>

[(keep_text_aligned yes | no)] <8>

)
...

- <1> The ``thickness`` token attribute defines the line thickness of the dimension.
- <2> The ``arrow_length`` token attribute defines the length of the dimension arrows.
- <3> The ``text_position_mode`` token attribute defines the position mode of the dimension text.
- Valid position modes are as follows:
- * 0 - Text is outside the dimension line.
 - * 1 - Text is in line with the dimension line.
 - * 2 - Text has been manually placed by the user.
- <4> The ``arrow_direction`` token attribute defines the direction of the dimension arrows.
- Only ``aligned`` and ``orthogonal`` dimensions support this attribute. Valid directions are as follows:
- * ``outward``: The arrows face outward, pointing away from midpoint of the crossbar.
 - * ``inward``: The arrows face inward, pointing towards the midpoint of the crossbar.
- <5> The optional ``extension_height`` token attribute defines the length of the extension lines past the dimension crossbar.
- <6> The optional ``text_frame`` token attribute defines the style of the frame around the dimension text. This only applies to ``leader`` dimensions. Valid text frames are as follows:
- * 0 - No text frame.
 - * 1 - Rectangle.
 - * 2 - Circle.
 - * 3 - Rounded rectangle.
- <7> The optional ``extension_offset`` token attribute defines the distance from feature points to extension line start.
- <8> The optional ``keep_text_aligned`` token indicates that the dimension text should be kept in line with the dimension crossbar. When not defined, the dimension text is shown horizontally regardless of the orientation of the dimension.

=== Zone

The ``zone`` token defines a zone on the board or footprint. Zones serve two purposes in KiCad: filled copper zones and keep out areas.

(zone

| | |
|--|------|
| (net NET_NUMBER) | <1> |
| (net_name "NET_NAME") | <2> |
| (layer LAYER_DEFINITION) | <3> |
| (uuid UUID) | <4> |
| [(name "NAME")] | <5> |
| (hatch STYLE PITCH) | <6> |
| [(priority PRIORITY)] | <7> |
| (connect_pads [CONNECTION_TYPE] (clearance CLEARANCE)) | <8> |
| (min_thickness THICKNESS) | <9> |
| [(filled_areas_thickness no)] | <10> |
| [ZONE_KEEPOUT_SETTINGS] | <11> |
| ZONE_FILL_SETTINGS | <12> |
| (polygon COORDINATE_POINT_LIST) | <13> |
| [ZONE_FILL_POLYGONS...] | <14> |
| [ZONE_FILL_SEGMENTS...] | <15> |

)

...

- <1> The `net` token attribute defines by the net ordinal number which net in the xref:../sexpr-pcb/index.adoc#_nets_section[nets section] that the zone is part of.
- <2> The `net\_name` token attribute defines the xref:../sexpr-pcb/index.adoc#_nets_section[name of the net] if the zone is not a keep out area. The net name attribute will be an empty string if the zone is a keep out area.
- <3> The `layer` token defines the <<canonical_layer_names, canonical layer>> the zone resides on.
- <4> The `uuid` token defines the unique identifier of the zone object.
- <5> The optional `name` token attribute defines the name of the zone if one has been assigned.
- <6> The `hatch` token attributes define the zone outline display hatch style and pitch. Valid hatch styles are `none`, `edge`, and `full`.
- <7> The optional `priority` attribute defines the zone priority if it is not zero.
- <8> The `connect\_pads` token attributes define the pad connection type and clearance. Valid pad connection types are `thru\_hole\_only`, `full`, and `no`. If the pad connection type is not defined, thermal relief pad connections are used.
- <9> The `min\_thickness` token attributed defines the minimum fill width allowed in the zone.
- <10> The optional `filled\_areas\_thickness` attribute `no` specifies if the zone like width is not used when determining the zone fill area. This is to maintain compatibility with older

board files that included the line thickness when performing zone fills when it is not defined.

<11> The optional <<_zone_keep_out_settings,zone keep out settings>> section defines the keep out items if the zone defines as a keep out area.

<12> The <<_zone_fill_settings,zone fill settings section>> defines how the zone is to be filled.

- * 0 - All footprint pads are not connect to zone.
- * 1 - All footprint pads are connected to zone using thermal relief.
- * 2 - All footprint pads are connected to zone using solid fill.
- * 3 - Only footprint through hole pads are connected to zone using thermal relief. Surface mount pads are connected using solid fill.

<13> The `polygon` token attribute defines the COORDINATE_POINT_LIST of <<_coordinate_point_list, X/Y coordinates>> of corner points of the polygon outline. the corners of the zone outline polygon.

<14> The optional <<_zone_fill_polygons,zone fill polygons section>> defines all of the polygons used to fill the zone. This section will not exist if the zone has not been filled or is filled with segments.

<15> The optional <<_zone_fill_segments, zone fill segments section>> defines a list of track segments used to fill the zone. This is only used when boards prior to version 4 of KiCad are loaded.

==== Zone Keep Out Settings

The optional `keepout` token attributes define which objects should be kept out of the zone. This section only applies to keep out zones.

...

```
(keepout
  (tracks KEEPOUT)                <1>
  (vias KEEPOUT)                  <2>
  (pads KEEPOUT)                  <3>
  (copperpour KEEPOUT)            <4>
  (footprints KEEPOUT)            <5>
)
```

...

<1> The `tracks` token attribute defines whether or not tracks should be excluded from the keep out area. Valid attributes are `allowed` and `not\_allowed`.

- <2> The `vias` token attribute defines whether or not vias should be excluded from the keep out area. Valid attributes are `allowed` and `not\_allowed`.
- <3> The `pads` token attribute defines whether or not pads should be excluded from the keep out area. Valid attributes are `allowed` and `not\_allowed`.
- <4> The `copperpour` token attribute defines whether or not copper pours should be excluded from the keep out area. Valid attributes are `allowed` and `not\_allowed`.
- <5> The `footprints` token attribute defines whether or not footprints should be excluded from the keep out area. Valid attributes are `allowed` and `not\_allowed`.

==== Zone Fill Settings

The `fill` token attributes define how the zone is to be filled.

```

...
(fill
  [yes]                                     <1>
  [(mode FILL_MODE)]                       <2>
  (thermal_gap GAP)                        <3>
  (thermal_bridge_width WIDTH)             <4>
  [(smoothing STYLE)]                     <5>
  [(radius RADIUS)]                       <6>
  [(island_removal_mode MODE)]             <7>
  [(island_area_min AREA)]                <8>
  [(hatch_thickness THICKNESS)]            <9>
  [(hatch_gap GAP)]                       <10>
  [(hatch_orientation ORIENTATION)]        <11>
  [(hatch_smoothing_level LEVEL)]          <12>
  [(hatch_smoothing_value VALUE)]          <13>
  [(hatch_border_algorithm TYPE)]          <14>
  [(hatch_min_hole_area AREA)]             <15>
)
...

```

- <1> The `yes` token specifies if the zone should be filled. If not specified, the zone is not filled and no additional attributes are required.

<2> The optional ``mode`` token attribute defines how the zone is filled. The only valid fill mode is ``hatched``. When not defined, the fill mode is solid.

<3> The optional ``thermal_gap`` token attribute defines the distance from the zone to all pad thermal relief connections to the zone.

<4> The optional ``thermal_bridge_width`` token attribute defines the spoke width for all pad thermal relief connection to the zone.

<5> The optional ``smoothing`` token attributes define the style of corner smoothing.
Valid smoothing styles are ``chamfer`` and ``fillet``.

<6> The optional ``radius`` token defines the radius of the corner smoothing.

<7> The optional ``island_removal_mode`` token attribute defines the island removal mode. Valid island removal modes are:

- * 0 - Always remove islands.
- * 1 - Never remove islands.
- * 2 - Minimum area island to allow.

<8> The optional ``island_area_min`` token attribute defines the minimum allowable zone island.
This only valid when the remove islands mode is set to 2.

<9> The optional ``hatch_thickness`` token attribute defines the thickness for hatched fills.

<10> The optional ``hatch_gap`` token attribute defines the distance between lines for hatched fills.

<11> The optional ``hatch_orientation`` token attribute defines the line angle for hatched fills.

<12> The optional ``hatch_smoothing_level`` token attribute defines how hatch outlines are smoothed.
Valid hatch smoothing levels are:

- * 0 - No smoothing.
- * 1 - Fillet.
- * 2 - Arc minimum.
- * 3 - Arc maximum.

<13> The optional ``hatch_smoothing_value`` token attribute defines the ratio between the hole and the chamfer/fillet size.

<14> The optional ``hatch_border_algorithm`` token attribute defines the if the zone line thickness is used when performing a hatch fill. Valid values for the hatch border algorithm are:

- * 0 - Use zone minimum thickness.
- * 1 - Use hatch thickness.

<15> The optional ``hatch_min_hole_area`` token attribute defines the minimum area a hatch file hole can be.

==== Zone Fill Polygons
The ``filled_polygon`` token defines the polygons used to fill the zone. This token will not exist if the zone has not been filled.

...

```
(filled_polygon
  (layer LAYER_DEFINITION) <1>
  COORDINATE_POINT_LIST <2>
)
```

...

<1> The `layer` token attribute defines the <<_canonical_layer_names, canonical layer>> the zone fill resides on.

<2> The COORDINATE_POINT_LIST defines the list of polygon

<<_coordinate_point_list, X/Y coordinates>> used to fill the zone.
==== Zone Fill Segments

The `filled\_segments` token defines the segments used to fill the zone. This is only used when loading boards prior to version 4 which filled zones with segments. Once the zone has been refilled, it will be filled with polygons and this token will not exist.

...

```
(fill_segments
  (layer LAYER_DEFINITION) <1>
  COORDINATED_POINT_LIST <2>
)
```

...

<1> The `layer` token attribute defines the <<_canonical_layer_names,canonical layer>> the zone fill resides on.

<2> The COORDINATE_POINT_LIST defines the list of

<<_coordinate_point_list,X and Y coordinates>> of the segments used to fill the zone.

== Group

The `group` token defines a group of items.

```

...

(group
  "NAME"                                <1>
  (id UUID)                             <2>
  (members UUID1 ... UUIDN)             <3>
)
...

```

<1> The name attribute defines the name of the group.

<2> The `id` token attribute defines the unique identifier of the group.

<3> The `members` token attributes define a list of unique identifiers of the objects belonging to the group.

== Schematic and Symbol Library Common Syntax

This section defines all syntax that is shared across the symbol library and schematic file formats.

=== Schematic Coordinates

* The minimum internal unit for schematic and symbol library files is one nanometer so there is maximum resolution of four decimal places or 0.0001 mm. Any precision beyond four places will be truncated.

=== Symbol Unit Identifier

Symbol unit identifiers define how symbol units are identified. The unit identifier is a quoted string have the format "NAME_UNIT_STYLE". "NAME" is the parent symbol name. "UNIT" is an integer that identifies which unit the symbol represents. A "UNIT" value of zero (0) indicates that the symbol is common to all units. The "STYLE" indicates which body style the unit represents. NOTE: This identifier is a temporary solution until the full symbol inheritance model is

implemented.

NOTE: KiCad only supports two body styles so the only valid values for the "STYLE" are 1 and 2.

=== Fill Definition

The ``fill`` token defines how schematic and symbol library graphical items are filled.

...

```
(fill
  (type none | outline | background)          <1>
)
```

...

<1> The ``fill`` token attributes define how the arc is filled. The table below describes the fill type modes.

The table below defines the schematic and symbol graphical object fill modes.

[options="header"]

|===

|Token |Description

|none |Graphic item not filled.

|outline |Graphic item filled with the line color.

|background |Graphic filled with the theme background color.

|===

=== Symbols

The ``symbol`` token defines a symbol or sub-unit of a parent symbol. There can be zero or more ``symbol`` tokens in a symbol library file.

...

```
(symbol
  "LIBRARY_ID" | "UNIT_ID"          <1>
```

| | |
|--------------------------------------|------|
| [(extends "LIBRARY_ID")] | <2> |
| [(pin_numbers hide)] | <3> |
| [(pin_names [(offset OFFSET)] hide)] | <4> |
| (in_bom yes no) | <5> |
| (on_board yes no) | <6> |
| SYMBOL_PROPERTIES... | <7> |
| GRAPHIC_ITEMS... | <8> |
| PINS... | <9> |
| UNITS... | <10> |
| [(unit_name "UNIT_NAME")] | <11> |
|) | |
| ... | |

<1> Each symbol must have a unique

<<_library_identifier,"LIBRARY_ID">> for each top level symbol in the library or a unique <<_symbol_unit_identifier,"UNIT_ID">> for each unit embedded in a parent symbol. Library identifiers are only valid at top level symbols and unit identifiers are only valid as unit symbols inside a parent symbol.

<2> The optional `extends` token attribute defines the <<_library_identifier,"LIBRARY_ID">> of another symbol inside the current library from which to derive a new symbol. Extended symbols currently can only have different <<_symbol_properties, SYMBOL_PROPERTIES>> than their parent symbol.

<3> The optional `pin\_numbers` token defines the visibility setting of the symbol pin numbers for the entire symbol. If not defined, the all of the pin numbers in the symbol are visible.

<4> The optional `pin\_names` token defines the attributes for all of the pin names of the symbol. The optional `offset` token defines the pin name offset for all pin names of the symbol. If not defined, the pin name offset is 0.508mm (0.020"). If the `pin\_name` token is not defined, the all symbol pins are shown with the default offset.

<5> The `in\_bom` token, defines if a symbol is to be include in the bill of material output. The only valid attributes are yes and no.

<6> The `on\_board` token, defines if a symbol is to be exported from the schematic to the printed circuit board. The only valid attributes are yes and no.

<7> The <<_symbol_properties,SYMBOL_PROPERTIES>> is a list of properties that define the symbol. The following properties are mandatory when defining a parent symbol: "Reference", "Value", "Footprint", and "Datasheet". All other properties are optional. Unit symbols cannot have

any properties.

- <8> The <<_symbol_graphic_items,GRAPHIC ITEMS>> section is list of graphical arcs, circles, curves, lines, polygons, rectangles and text that define the symbol drawing. This section can be empty if the symbol has no graphical items.
- <9> The <<_symbol_pin,PINS>> section is a list of pins that are used by the symbol. This section can be empty if the symbol does not have any pins.
- <10> The optional UNITS can be one or more child `symbol` tokens embedded in a parent `symbol`.
- <11> The optional `unit\_name` token defines the display name of a subunit in the symbol editor and symbol chooser. It is only permitted for child `symbol` tokens embedded in a parent `symbol`.

==== Symbol Properties

The `property` token defines a symbol property when used inside a `symbol` definition.

NOTE: Symbol properties are different than <<_properties,general purpose properties>> defined above.

```
...
(property
  "KEY"                                <1>
  "VALUE"                              <2>
  (id N)                               <3>
  POSITION_IDENTIFIER                   <4>
  TEXT_EFFECTS                         <5>
}
```

- <1> The "KEY" string defines the name of the property and must be unique.
- <2> The "VALUE" string defines the value of the property.
- <3> The `id` token defines an integer ID for the property and must be unique.
- <4> The POSITION_IDENTIFIER defines the <<_position_identififer,X and Y coordinates and rotation angle>> of the property.
- <5> The TEXT_EFFECTS section defines how the <<_text_effects,text is displayed>>.
- ==== Mandatory Symbol Properties

The table below defines the mandatory properties for parent symbols.

.Mandatory Properties

[options="header",cols="25%,15%,60%,20%"]

|===

| Key | Ordinal | Description | Empty Allowed |
|-----|---------|-------------|---------------|
|-----|---------|-------------|---------------|

| | | | |
|-----------|---|-----------------------------|----|
| Reference | 0 | Symbol reference designator | No |
|-----------|---|-----------------------------|----|

| | | | |
|-------|---|---------------------|----|
| Value | 1 | Symbol value string | No |
|-------|---|---------------------|----|

| | | | |
|-----------|---|---|-----|
| Footprint | 2 | Symbol footprint <<_library_identifier,library identifier>> | Yes |
|-----------|---|---|-----|

| | | | |
|-----------|---|-----------------------|-----|
| Datasheet | 3 | Symbol datasheet link | Yes |
|-----------|---|-----------------------|-----|

|===

===== Reserved Symbol Property Keys

The list below is the list of property keys reserve by KiCad and cannot be user for user defined properties.

* `ki\_keywords`

* `ki\_description`

* `ki\_locked`

* `ki\_fp\_filters`

==== Symbol Graphic Items

This section documents the various graphical objects used in symbol definitions.

==== Symbol Arc

The `arc` token defines a graphical arc in a symbol definition.

...

(arc

(start X Y) <1>

(mid X Y) <2>

```

        (end X Y)                                <3>

        STROKE_DEFINITION                        <4>

        FILL_DEFINITION                          <5>

    )
...

```

- <1> The `start` token defines the coordinates of start point of the arc.
- <2> The `mid` token defines the coordinates of mid point of the arc.
- <3> The `end` token defines the coordinates of end point of the arc.
- <4> The STROKE_DEFINITION defines how the arc <<_stroke_definition,outline is drawn>>.
- <5> The `fill` token attributes define how the arc is <<_fill_definition,filled>>.

==== Symbol Circle

The `circle` token defines a graphical circle in a symbol definition.

```

...

(circle
    (center X Y)                                <1>

    (radius RADIUS)                            <2>

    STROKE_DEFINITION                          <3>

    FILL_DEFINITION                            <4>

)
...

```

- <1> The `center` token defines the coordinates of center point of the circle.
- <2> The radius token defines the length of the radius of the circle.
- <3> The STROKE_DEFINITION defines how the circle <<_stroke_definition,outline is drawn>>.
- <4> The FILL_DEFINITION defines how the circle is <<_fill_definition,filled>>.

==== Symbol Curve

The `bezier` token defines a graphical .

https://en.wikipedia.org/wiki/B%C3%A9zier_curve#Quadratic_B%C3%A9zier_curves[Qubic Bezier curve].

```

(bezier
  COORDINATE_POINT_LIST          <1>
  STROKE_DEFINITION              <2>
  FILL_DEFINITION                <3>
)
...

```

<1> The COORDINATE_POINT_LIST defines the four

<<_coordinate_point_list, X/Y coordinates>> of each point of the curve.

<2> The STROKE_DEFINITION defines how the curve <<_stroke_definition, outline is drawn>>.

<3> The FILL_DEFINITION defines how the curve is <<_fill_definition, filled>>.

==== Symbol Line

The `polyline` token defines one or more graphical lines that may or may not define a polygon.

```

...

(polyline
  COORDINATE_POINT_LIST          <1>
  STROKE_DEFINITION              <2>
  FILL_DEFINITION                <3>
)
...

```

<1> The COORDINATE_POINT_LIST defines the list of

<<_coordinate_point_list, X/Y coordinates>> of the line(s). There must be a minimum of two points.

<2> The STROKE_DEFINITION defines how the polygon formed by the lines

<<_stroke_definition, outline is drawn>>.

<3> The `fill` token attributes define how the polygon formed by the lines is

<<_fill_definition, filled>>.

==== Symbol Rectangle

The `rectangle` token defines a graphical rectangle in a symbol definition.

```

...
(rectangle

```

```

        (start X Y)                                <1>
        (end X Y)                                  <2>
        STROKE_DEFINITION                          <3>
        FILL_DEFINITION                            <4>
    )
...

```

<1> The `start` token attributes define the coordinates of the start point of the rectangle.

<2> The `end` token attributes define the coordinates of the end point of the rectangle.

<3> The STROKE_DEFINITION defines how the rectangle <<_stroke_definition,outline is drawn>>.

<4> The FILL_DEFINITION defines how the rectangle is <<_fill_definition,filled>>.

==== Symbol Text

The `text` token defines graphical text in a symbol definition.

```

...
    (text
        "TEXT"                                     <1>
        POSITION_IDENTIFIER                         <2>
        (effects TEXT_EFFECTS)                    <3>
    )
...

```

<1> The "TEXT" attribute is a quoted string that defines the text.

<2> The POSITION_IDENTIFIER defines the

<<_position_identifier,X and Y coordinates and rotation angle>> of the text.

<3> The TEXT_EFFECTS defines how the <<_text_effects,text is displayed>>.

==== Symbol Pin

The `pin` token defines a pin in a symbol definition.

```

...
    (pin

```

```

    PIN_ELECTRICAL_TYPE                <1>
    PIN_GRAPHIC_STYLE                  <2>
    POSITION_IDENTIFIER                  <3>
    (length LENGTH)                    <4>
    (name "NAME" TEXT_EFFECTS)         <5>
    (number "NUMBER" TEXT_EFFECTS)     <6>
  )
...

```

- <1> The PIN_ELECTRICAL_TYPE defines the pin electrical connection. See table below for valid pin electrical connection types and descriptions.
- <2> The PIN_GRAPHICAL_STYLE defines the graphical style used to draw the pin. See table below for valid pin graphical styles and descriptions.
- <3> The POSITION_IDENTIFIER defines the
 <<_position_identififer,X and Y coordinates and rotation angle>> of the connection point of the pin relative to the symbol origin position. The only supported rotation angles for pins are 0, 90, 180, and 270 degrees.
- <4> The `length` token attribute defines the LENGTH of the pin.
- <5> The `name` token defines a quoted string containing the NAME of the pin and the TEXT_EFFECTS defines how the <<_text_effects,text is displayed>>.
- <6> The `number` token defines a quoted string containing the NUMBER of the pin and the TEXT_EFFECTS defines how the <<_text_effects,text is displayed>>.

The table below defines the pin electrical types.

```
[options=header,cols="1,3"]
```

```
|===
```

| Token | Description |
|---------------|--|
| input | Pin is an input. |
| output | Pin is an output. |
| bidirectional | Pin can be both input and output. |
| tri_state | Pin is a tri-state output. |
| passive | Pin is electrically passive. |
| free | Not internally connected. |
| unspecified | Pin does not have a specified electrical type. |

| | |
|----------------|-----------------------------------|
| power_in | Pin is a power input. |
| power_out | Pin is a power output. |
| open_collector | Pin is an open collector output. |
| open_emitter | Pin is an open emitter output. |
| no_connect | Pin has no electrical connection. |
| === | |

The table below defines the pin graphical styles.

[options=header,cols="30%,^70%"]

| | |
|-----------------|--|

title: Board File Format

weight: 43

:TOC:

.Summary The s-expression printed circuit board file format.

<!--more-->

== Introduction

This documents the s-expression board file format for all versions of KiCad from 6.0.

* Printed circuit board files use the `.kicad\_pcb` extension.

NOTE: This file format was introduced with the launch of KiCad 4.0.

NOTE: Prior to version 6 of KiCad, strings were only quoted when necessary. Saving an older board file to the latest file format will result in these strings being quoted even though there is no functional change in the board itself.

== Layout

A board file includes the following sections:

* <<_header_section,Header>>

* <<_general_section,General>>

* <<_layers_section,Layers>>

* <<_setup_section,Setup>>

- * <<_property_section,Properties>>
- * <<_nets_section,Nets>>
- * <<_footprint_section,Footprints>>
- * <<_graphic_items_section,Graphic Items>>
- * <<_images,Images>>
- * <<_tracks_section,Tracks>>
- * <<_zones_section,Zones>>
- * <<_group_section,Groups>>

NOTE: The section order is not critical other than the header must be the first token. Some sections can may omitted.

== Header Section

The `kicad\_pcb` token indicates that it is KiCad board file. This section is required.

NOTE: Third party scripts should not use `pcbnew` as the generator identifier. Please use some other identifier so that bugs introduced by third party generators are not confused with the board file created by KiCad.

...

(kicad_pcb

(version VERSION) <1>

(generator GENERATOR) <2>

;; contents of board file... <3>

)

...

<1> The `version` token attribute defines the board version using the YYYYMMDD date format.

<2> The `generator` token attribute defines the program used to write the file.

<3> The remaining sections of the board definition goes here.

== General Section

The ``general`` token define general information about the board. This section is required.

NOTE: Most of the redundant information in the ``general`` section prior to version 6 has been removed. The removed information does not affect the board output.

```
...  
  
  (general  
    (thickness THICKNESS)                <1>  
  )  
...
```

<1> The ``thickness`` token attribute defines the overall board thickness.

== Page Section

See the `xref:../sexpr-intro/index.adoc#_page_settings`[page settings definition] in the common s-expression section. This section is required.

== Layers Section

The ``layers`` token defines all of the layers used by the board. This section is required.

```
...  
  
  (layers  
    (  
      ORDINAL                <1>  
      "CANONICAL_NAME"       <2>  
      TYPE                   <3>  
      ["USER_NAME"]          <4>  
    )  
  
    ;; remaining layers...  
  )
```

...

- <1> The layer `ORDINAL` is an integer used to associate the layer stack ordering. This is mostly to ensure correct mapping when the number of layers is increased in the future.
- <2> The <<_canonical_layer_names,`CANONICAL\_NAME`>> is the layer name defined for internal board use.
- <3> The layer `TYPE` defines the type of layer and can be defined as `jumper`, `mixed`, `power`, `signal`, or `user`.
- <4> The optional `USER\_NAME` attribute defines the custom user name.

== Setup Section

The `setup` token is used to store the current settings such as default item sizes and other options used by the board. This section is required.

[source,lisp]

```
(setup
  [(STACK_UP_SETTINGS)]                <1>
  (pad_to_mask_clearance CLEARANCE)    <2>
  [(solder_mask_min_width MINIMUM_WIDTH)] <3>
  [(pad_to_paste_clearance CLEARANCE)]  <4>
  [(pad_to_paste_clearance_ratio RATIO)] <5>
  [(aux_axis_origin X Y)]              <6>
  [(grid_origin X Y)]                  <7>
  (PLOT_SETTINGS)                      <8>
)
```

- <1> The optional <<_stack_up_settings,`STACK\_UP\_SETTINGS`>> define the parameters required to manufacture the board.
- <2> The `pad\_to\_mask\_clearance` token defines the clearance between footprint pads and the solder mask.
- <3> The optional `solder\_mask\_min\_width` defines the minimum solder mask width. If not defined,

the minimum width is zero.

- <4> The optional ``pad_to_paste_clearance`` defines the clearance between footprint pads and the solder paste layer. If not defined, the clearance is zero.
- <5> The optional ``pad_to_paste_clearance_ratio`` is the percentage (from 0 to 100) of the footprint pad to make the solder paste. If not defined, the ratio is 100% (the same size as the pad).
- <6> The optional ``aux_axis_origin`` defines the auxiliary origin if it is set to anything other than (0,0).
- <7> The optional ``grid_origin`` defines the grid original if it is set to anything other than (0,0).
- <8> The `<<_plot_settings,`PLOT_SETTINGS`>>` define how the board was last plotted.

=== Stack Up Settings

The optional ``stackup`` token defines the board stack up settings and is defined in the `<<_setup_section,setup section>>`.

```
...  
  
(stackup  
  (LAYER_STACK_UP_DEFINITIONS)           <1>  
  [(copper_finish "FINISH")]              <2>  
  [(dielectric_constraints yes | no)]      <3>  
  [(edge_connector yes | bevelled)]       <4>  
  [(castellated_pads yes)]                <5>  
  [(edge_plating yes)]                    <6>  
)  
...
```

- <1> The layer stack up definitions is a list of layer `<<_stack_up_layer_settings,settings for each layer>>` required to manufacture a board including the dielectric material between the actual layers defined in the board editor.
- <2> The optional ``copper_finish`` token is a string that defines the copper finish used to manufacture the board.
- <3> The optional ``dielectric_constraints`` token define if the board should meet all dielectric requirements.
- <4> The optional ``edge_connector`` token defines if the board has an edge connector and if the edge connector is bevelled.

<5> The optional `castellated\_pads` token defines if the board edges contain castellated pads.

<6> The optional `edge\_plating` token defines if the board edges should be plated.

=== Stack Up Layer Settings

The `layer` token defines the stack up setting of a single layer in the board

<<_stack_up_settings,stack up settings>>.

```
...
    (layer
      "NAME" | dielectric                                <1>
      NUMBER                                              <2>
      (type "DESCRIPTION")                               <3>
      [(color "COLOR")]                                  <4>
      [(thickness THICKNESS)]                             <5>
      [(material "MATERIAL")]                             <6>
      [(epsilon_r DIELECTRIC_RESISTANCE)]                 <7>
      [(loss_tangent LOSS_TANGENT)]                       <8>
    )
  ...
```

<1> The layer name attribute is either one of the

<<_canonical_layer_names,canonical copper or technical layer names>> listed in the table above
or `dielectric ID` if it is dielectric layer.

<2> The layer number attribute defines the stack order of the layer.

<3> The layer `type` token defines a string that describes the layer.

<4> The optional layer `color` token defines a string that describes the layer color. This is
only used on solder mask and silkscreen layers.

<5> The optional layer `thickness` token defines the thickness of the layer where appropriate.

<6> The optional layer `material` token defines a string that describes the layer material where
appropriate.

<7> The optional layer `epsilon\_r` token defines the dielectric constant of the layer material.

<8> The optional layer `loss\_tangent` token defines the dielectric loss tangent of the layer

=== Plot Settings

The `pcbplotparams` token defines the plotting and printing settings used for the last plot
and is defined in the <<_setup_section,set up section>>.

...

```
(pcbplotparams
  (layerselection HEXADECIMAL_BIT_SET) <1>
  (disableapertmacros true | false) <2>
  (usegerberextensions true | false) <3>
  (usegerberattributes true | false) <4>
  (usegerberadvancedattributes true | false) <5>
  (creategerberjobfile true | false) <6>
  (svguseinch true | false) <7>
  (svgprecision PRECISION) <8>
  (excludeedgelayer true | false) <9>
  (plotframeref true | false) <10>
  (viasonmask true | false) <11>
  (mode MODE) <12>
  (useauxorigin true | false) <13>
  (hpglpennumber NUMBER) <14>
  (hpglpenspeed SPEED) <15>
  (hpglpendingiameter DIAMETER) <16>
  (dxfpolygonmode true | false) <17>
  (dxfimperialunits true | false) <18>
  (dxfusepcbnewfont true | false) <19>
  (psnegative true | false) <20>
  (psa4output true | false) <21>
  (plotreference true | false) <22>
  (plotvalue true | false) <23>
  (plotinvisibletext true | false) <24>
  (sketchpadsonfab true | false) <25>
  (subtractmaskfromsilk true | false) <26>
  (outputformat FORMAT) <27>
  (mirror true | false) <28>
  (drillshape SHAPE) <29>
  (scaleselection 1) <30>
  (outputdirectory "PATH") <31>
)
```

...

- <1> The ``layersselection`` token defines a hexadecimal bit set of the layers to plot.
 - <2> The ``disableapertmacros`` token defines if aperture macros are to be used in gerber plots.
 - <3> The ``usegerberextensions`` token defines if the Protel layer file name extensions are to be used in gerber plots.
 - <4> The ``usegerberattributes`` token defines if the X2 extensions are used in gerber plots.
 - <5> The ``usegerberadvancedattributes`` token defines if the netlist information should be included in gerber plots.
 - <6> The ``creategerberjobfile`` token defines if a job file should be created when plotting gerber files.
 - <7> The ``svguseinch`` token defines if inch units should be use when plotting SVG files.
 - <8> The ``svgprecision`` token defines the units precision used when plotting SVG files.
 - <9> The ``excludeedgelayer`` token defines if the board edge layer is plotted on all layers.
 - <10> The ``plotframeref`` token defines if the border and title block should be plotted.
 - <11> The ``viasonmask`` token defines if the vias are to be tented.
 - <12> The ``mode`` token defines the plot mode. An attribute of 1 plots in the normal mode and an attribute of 2 plots in the outline (sketch) mode.
 - <13> The ``useauxorigin`` token determines if all coordinates are offset by the defined user origin.
 - <14> The ``hpglpennumber`` token defines the integer pen number used for HPGL plots.
 - <15> The ``hpglpenspeed`` token defines the integer pen speed used for HPGL plots.
 - <16> The ``hpglpendiameter`` token defines the floating point pen size for HPGL plots.
 - <17> The ``dxfpolygonmode`` token defines if the polygon mode should be used for DXF plots.
 - <18> The ``dxfimperialunits`` token defines if imperial units should be used for DXF plots.
 - <19> The ``dxfusepcbnewfont`` token defines if the Pcbnew font (vector font) or the default font should be used for DXF plots.
 - <20> The ``psnegative`` token defines if the output should be the negative for PostScript plots.
 - <21> The ``psa4output`` token defines if the A4 page size should be used for PostScript plots.
 - <22> The ``plotreference`` token defines if hidden reference field text should be plotted.
 - <23> The ``plotvalue`` token defines if hidden value field text should be plotted.
 - <24> The ``plotinvisibletext`` token defines if hidden text other than the reference and value fields should be plotted.
 - <25> The ``sketchpadsonfab`` token defines if pads should be plotted in the outline (sketch) mode.
 - <26> The ``subtractmaskfromsilk`` toke defines if the solder mask layers should be subtracted from the silk screen layers for gerber plots.
 - <27> The ``outputformat`` token defines the last plot type.
- * 0 - gerber

* 1 - PostScript

* 2 - SVG

* 3 - DXF

* 4 - HPGL

* 5 - PDF

<28> The `mirror` token defines if the plot should be mirrored.

<29> The `drillshape` token defines the type of drill marks used for drill files.

<30> The `scaleselection` token defines ****DOCUMENT ME****.

<31> The `outputdirectory` token defines the path relative to the current project path where the plot files will be saved.

== Property Section

See the [xref:../sexpr-intro/index.adoc#_properties\[properity definition\]](#) in the s-expression common section. If no properties are defined, this section will not exist.

== Nets Section

The `net` token defines a net for the board. This section is required.

NOTE: The net class section has been moved out of the board file into the design rules file.

...

(net

ORDINAL <1>

"NET_NAME" <2>

)

...

<1> The ordinal attribute is an integer that defines the net order.

<2> The net name is a string that defines the name of the net.

== Footprint Section

See the [xref:../sexpr-intro/index.adoc#_footprint\[footprint\]](#) in the s-expression board common

definitions. This section will not exist if there are no footprints on the board.

`== Graphic Items Section`

See the `xref:../sexpr-intro/index.adoc#_graphic_items[Graphic Items]` section in the s-expression board common definitions. This section will not exist if there are no graphics on the board.

`== Images Section`

See the `xref:../sexpr-intro/index.adoc#_images[Images]` section in the s-expression board common definitions. This section will not exist if there are no images on the board.

`== Tracks Section`

This section lists all of `<<_track_segment_syntax,segment>>`, `<<_track_via_syntax,via>>`, and `<<_track_arc_syntax,arc>>` objects that make up tracks on the board.

`=== Track Segment`

The ``segment`` token defines a track segment.

`...`

```
(segment
  (start X Y)                <1>
  (end X Y)                  <2>
  (width WIDTH)              <3>
  (layer LAYER_DEFINITION)   <4>
  [(locked)]                 <5>
  (net NET_NUMBER)           <6>
  (tstamp UUID)              <7>
)
```

`...`

- <1> The `start` token defines the coordinates of the beginning of the line.
- <2> The `end` token defines the coordinates of the end of the line.
- <3> The `width` token defines the line width.
- <4> The `layer` token defines the <<_canonical_layer_names, canonical layer>> the track segment resides on.
- <5> The optional `locked` token defines if the line cannot be edited.
- <6> The `net` token defines by the net ordinal number which net in the <<_net_section,net section>> that the segment is part of.
- <7> The `tstamp` token defines the unique identifier of the line object.

=== Track Via

The `via` token defines a track via.

...

```
(via
  [TYPE]                                <1>
  [(locked)]                            <2>
  (at X Y)                              <3>
  (size DIAMETER)                       <4>
  (drill DIAMETER)                      <5>
  (layers LAYER1 LAYER2)                <6>
  [(remove_unused_layers)]              <7>
  [(keep_end_layers)]                   <8>
  [(free)]                              <9>
  (net NET_NUMBER)                      <10>
  (tstamp UUID)                         <11>
)
```

...

- <1> The optional type attribute specifies the via type. Valid via types are `blind` and `micro`.

If no type is defined, the via is a through hole type.

- <2> The optional `locked` token defines if the line cannot be edited.
- <3> The `at` token attributes define the coordinates of the center of the via.
- <4> The `size` token attribute defines the diameter of the via annular ring.

- <5> The `drill` token attribute defines the drill diameter of the via.
- <6> The `layers` token attributes define the <<canonical_layer_names, canonical layer set>> the via connects.
- <7> The optional `remove\_unused\_layers` token specifies ****DOCUMENT ME****.
- <8> The optional `keep\_end\_layers` token specifies ****DOCUMENT ME****. This token is only defined when the `remove\_unused\_layers` token is defined.
- <9> The optional `free` token indicates that the via is free to be moved outside it's assigned net.
- <10> The `net` token attribute defines by net ordinal number which net in the <<_net_section,net section>> that the segment is part of.
- <11> The `tstamp` token defines the unique identifier of the line object.

=== Track Arc

The `arc` token defines a track arc.

...

```
(arc
  (start X Y)                <1>
  (mid X Y)                  <2>
  (end X Y)                   <3>
  (width X Y)                 <4>
  (layer LAYER_DEFINITION)    <5>
  [(locked)]                  <6>
  (net NET_NUMBER)            <7>
  (tstamp UUID)               <8>
)
```

...

- <1> The `start` token defines the coordinates of the beginning of the arc.
- <2> The `mid` token defines the coordinates of the mid point of the radius of the arc.
- <3> The `end` token defines the coordinates of the end of the arc.
- <4> The `width` token defines the line width.
- <5> The `layer` token defines the <<canonical_layer_names, canonical layer>> the track arc resides on.

<6> The optional ``locked`` token defines if the line cannot be edited.

<7> The ``net`` token defines by the net ordinal number which net in the
 `<<_net_section,net section>>` that the segment is part of.

<8> The ``tstamp`` token defines the unique identifier of the line object.

== Zones Section

See the `xref:../sexpr-intro/index.doc#_zone`[zone definition] in the s-expression board common definitions. This section will not exist if there are no zones on the board.

== Group Section

See the `xref:../sexpr-intro/index.doc#_group`[group definition] in the s-expression board common definitions. This section will not exist if there are no groups on the board.

== Board Example:

title: Schematic File Format

weight: 45

:TOC:

.Summary The s-expression schematic file format.

<!--more-->

== Introduction

This documents the s-expression schematic file format for all versions of KiCad from 6.0.

* Schematic files use the `.kicad\_sch` extension.

=== Instance Path

Because KiCad schematics can support multiple instances of the same schematic using hierarchical sheets, information for shared sheets is done using paths consisting of the xref:../sexpr-intro/index.adoc#_universally_unique_identifier[universally unique identifiers] that represent the hierarchical path for the sheet the instance separated by a forward slash ('/'). A typical instance path would look like:

...

"/00000000-0000-0000-0000-00004b3a13a4/00000000-0000-0000-0000-00004b617b88"

...

WARNING: The first identifier must be the root <<_hierarchical_sheet_section, sheet>> which is the same identifier as the root schematic file.

=== Label and Pin Shapes

The table below defines the valid shape tokens <<_global_label_section,global labels>>, <<_hierarchical_label_section,hierarchical labels>>, and <<_hierarchical_sheet_pin_definition, hierarchical sheet pins>>.

[options="header",cols="25%,50%,^25%",]

|===

|Token

|Definition

|Image

|input

|Label or pin is an input shape

|image:images/label-shape-input.png[images/label_shape_input]

|output

|Label or pin is an output shape

|image:images/label-shape-output.png[images/label_shape_output]

|bidirectional

|Label or pin is a bidirectional shape

|image:images/label-shape-bidirectional.png[images/label_shape_bidirectional]

|tri_state

|Label or pin is a tri-state shape

|image:images/label-shape-tristate.png[images/label_shape_tristate]

|passive

|Label or pin is a tri-state shape

|image:images/label-shape-passive.png[images/label_shape_passive]

|===

== Layout

A schematic file includes the following sections:

- * <<_header_section,Header>>
- * <<_unique_identifier_section,Unique Identifier>>
- * xref:../sexpr-intro/index.adoc#_page_settings[Page Settings]
- * xref:../sexpr-intro/index.adoc#_title_block[Title Block Section]
- * <<_library_symbol_section,Symbol Library Symbol Definition>>
- * <<_junction_section,Junction Section>>
- * <<_no_connect_section,No Connect Section>>
- * <<_wire_and_bus_section,Wire and Bus Section>>
- * <<_image_section,Image Section>>
- * <<_graphical_line_section,Graphical Line Section>>
- * <<_graphical_text_section,Graphical Text Section>>
- * <<_local_label_section,Local Label Section>>
- * <<_global_label_section,Global Label Section>>
- * <<_symbol_section,Symbol Section>>
- * <<_hierarchical_sheet_section,Hierarchical Sheet Section>>
- * <<_root_sheet_instance_section,Root Sheet Instance Section>>

== Header Section

The `kicad\_sch` token indicates that it is KiCad schematic file. This section is required.

NOTE: Third party scripts should not use `eeschema` as the generator identifier. Please use some other identifier so that bugs introduced by third party generators are not confused with a schematic file created by KiCad.

...

```
(kicad_sch
  (version VERSION)                                <1>
  (generator GENERATOR)                             <2>

  ;; contents of the schematic file...               <3>
)
```

...

<1> The `version` token attribute defines the schematic version using the YYYYMMDD date format.

<2> The `generator` token attribute defines the program used to write the file.

<3> The schematic sections go here.

== Unique Identifier Section

The `uuid` token defines the globally unique identifier that identifies the schematic.

...

UNIQUE_IDENTIFIER <1>

...

NOTE Only the root schematic identifier is used as the virtual root sheet identifier. All other identifiers are belong to <<_hierarchical_sheet_section,hierarchical sheet objects>>.

<1> The UNIQUE_IDENTIFIER defines the

xref:../sexpr-intro/index.adoc#_universally_unique_identifier[universally unique identifier] for the schematic file. This identifier is used when creating hierarchical sheet paths which are used to reference symbol instance data and <<_hierarchical_sheet_instance_section,hierarchical sheet instance>> information.

== Library Symbol Section

The `lib\_symbols` token defines a symbol library contain all of the symbols used in the schematic.

...

(lib_symbols
SYMBOL_DEFINITIONS... <1>
)

...

<1> A list of 0 or more xref:../sexpr-intro/index.adoc#_symbols[symbols].

== Junction Section

The ``junction`` token defines a junction in the schematic. The junction section will not exist if there are no junctions in the schematic.

```
...  
  
(junction  
    POSITION_IDENTIFIER                <1>  
    (diameter DIAMETER)              <2>  
    (color R G B A)                  <3>  
    UNIQUE_IDENTIFIER                <4>  
)  
...
```

<1> The POSITION_IDENTIFIER defines the

xref:../sexpr-intro/index.adoc#_position_identifier[X and Y coordinates] of the junction.

<2> The ``diameter`` token attribute defines the DIAMETER of the junction. A diameter of 0 is the default diameter in the system settings.

<3> The ``color`` token attributes define the Red, Green, Blue, and Alpha transparency of the junction. If all four attributes are 0, the default junction color is used.

<4> The UNIQUE_IDENTIFIER defines the

xref:../sexpr-intro/index.adoc#_universally_unique_identifier[universally unique identifier] for the junction.

== No Connect Section

The ``no_connect`` token defines a unused pin connection in the schematic. The no connect section will not exist if there are not any no connects in the schematic.

```
...  
  
(no_connect  
    POSITION_IDENTIFIER                <1>  
    UNIQUE_IDENTIFIER                <2>  
)  
...
```

<1> The POSITION_IDENTIFIER defines the

xref:../sexpr-intro/index.adoc#_position_identifier[X and Y coordinates] of the no connect.

<2> The UNIQUE_IDENTIFIER defines the

xref:../sexpr-intro/index.adoc#_universally_unique_identifier[universally unique identifier]
for the no connect.

== Bus Entry Section

The `bus\_entry` token defines a bus entry in the schematic. The bus entry section will not exist if there are no bus entries in the schematic.

...

(bus_entry

POSITION_IDENTIFIER <1>

(size X Y) <2>

STROKE_DEFINITION <3>

UNIQUE_IDENTIFIER <4>

)

...

<1> The POSITION_IDENTIFIER defines the

xref:../sexpr-intro/index.adoc#_position_identifier[X and Y coordinates] of the bus entry.

<2> The `size` token attributes define the X and Y distance of the end point from the position of the bus entry.

<3> The STROKE_DEFINITION defines how the bus entry

xref:../sexpr-intro/index.adoc#_stroke_definition[is drawn].

<4> The UNIQUE_IDENTIFIER defines the

xref:../sexpr-intro/index.adoc#_universally_unique_identifier[universally unique identifier]
for the bus entry.

== Wire and Bus Section

The `wire` and `bus` tokens define wires and buses in the schematic. This section will not exist if there are no wires or buses in the schematic.

...

```
(wire | bus
    COORDINATE_POINT_LIST          <1>
    STROKE_DEFINITION              <2>
    UNIQUE_IDENTIFIER              <3>
)
```

...

<1> The COORDINATE_POINT_LIST defines the list of

xref:../sexpr-intro/index.adoc#_coordinate_point_list[X and Y coordinates] of start and end points of the wire or bus.

<2> The STROKE_DEFINITION defines how the wire or bus

xref:../sexpr-intro/index.adoc#_stroke_definition[is drawn].

<3> The UNIQUE_IDENTIFIER defines the

xref:../sexpr-intro/index.adoc#_universally_unique_identifier[universally unique identifier] for the wire or bus.

== Image Section

See common xref:../sexpr-intro/index.adoc#_images[Images] section.

== Graphical Line Section

The `polyline` token defines one or more lines that may or may not represent a polygon. This section will not exist if there are no lines in the schematic.

...

```
(polyline
    COORDINATE_POINT_LIST          <1>
    STROKE_DEFINITION              <2>
    UNIQUE_IDENTIFIER              <3>
)
```

...

<1> The COORDINATE_POINT_LIST defines the list of

xref:../sexpr-intro/index.adoc#_coordinate_point_list[X/Y coordinates] of to draw line(s)

```

    "TEXT"                                <1>

    POSITION_IDENTIFIER                     <2>

    TEXT_EFFECTS                           <3>

    UNIQUE_IDENTIFIER                       <4>

)
...
<1> The TEXT is a quoted string that defines the label.

<2> The POSITION_IDENTIFIER defines the

    xref:../sexpr-intro/index.adoc#_position_identifier[X and Y coordinates and rotation angle]

    of the label.

<3> The TEXT_EFFECTS section defines how the

    xref:../sexpr-intro/index.adoc#_text_effects[label text is drawn].

<4> The UNIQUE_IDENTIFIER defines the

    xref:../sexpr-intro/index.adoc#_universally_unique_identifier[universally unique identifier]

    for the label.

```

== Global Label Section

The `global\_label` token defines a label name that is visible across all schematics in a design. This section will not exist if no global labels are defined in the schematic.

```

...

(global_label

    "TEXT"                                <1>

    (shape SHAPE)                          <2>

    [(fields_autoplaced)]                  <3>

    POSITION_IDENTIFIER                     <4>

    TEXT_EFFECTS                           <5>

    UNIQUE_IDENTIFIER                       <6>

    PROPERTIES                             <7>

)
...

```

<1> The TEXT is a quoted string that defines the global label.

- <2> The ``shape`` token attribute defines the way the global label is drawn. See table below for global label shapes.
- <3> The optional ``fields_autoplace`` is a flag that indicates that any PROPERTIES associated with the global label have been place automatically.
- <4> The POSITION_IDENTIFIER defines the
`xref:../sexpr-intro/index.adoc#_position_identifier`[X and Y coordinates and rotation angle] of the label.
- <5> The TEXT_EFFECTS section defines how the
`xref:../sexpr-intro/index.adoc#_text_effects`[global label text is drawn].
- <6> The UNIQUE_IDENTIFIER defines the
`xref:../sexpr-intro/index.adoc#_universally_unique_identifier`[universally unique identifier] for the global label.
- <7> The PROPERTIES section defines the
`xref:../sexpr-intro/index.adoc#_symbol_property`[properties] of the global label.
 Currently, the only supported property is the inter-sheet reference.

== Hierarchical Label Section

The ``hierarchical_label`` section defines labels that are used by

`<<_hierarchical_sheet_section,hierarchical sheets>>` to define connections between sheet in hierarchical designs. This section will not exist if no global labels are defined in the schematic.

...

```
(hierarchical_label
  "TEXT"                                     <1>
  (shape SHAPE)                             <2>
  POSITION_IDENTIFIER                         <3>
  TEXT_EFFECTS                             <4>
  UNIQUE_IDENTIFIER                         <5>
)
```

...

<1> The TEXT is a quoted string that defines the hierarchical label.

<2> The `shape` token attribute defines the way the hierarchical label is drawn. See table below for hierarchical label shapes.

<3> The POSITION_IDENTIFIER defines the
xref:../sexpr-intro/index.adoc#_position_identifier[X and Y coordinates and rotation angle]
of the label.

<4> The TEXT_EFFECTS section defines how the
xref:../sexpr-intro/index.adoc#_text_effects[hierarchical label text is drawn].

<5> The UNIQUE_IDENTIFIER defines the
xref:../sexpr-intro/index.adoc#_universally_unique_identifier[universally unique identifier]
for the hierarchical label.

== Symbol Section

The `symbol` token in the symbol section of the schematic defines an instance of a symbol from
<<_library_symbol_section,the library symbol section>> of the schematic.

...

```
(symbol
  "LIBRARY_IDENTIFIER" <1>
  POSITION_IDENTIFIER <2>
  (unit UNIT) <3>
  (in_bom yes|no) <4>
  (on_board yes|no) <5>
  UNIQUE_IDENTIFIER <6>
  PROPERTIES <7>
  (pin "1" (uuid e148648c-6605-4af1-832a-31eaf808c2f8)) <8>
  (instances <9>
    (project "PROJECT_NAME" <10>
      (path "PATH_INSTANCE" <11>
        (reference "REFERENCE") <12>
        (unit UNIT) <13>
      )
      ;; Optional symbol instances for this `project`...
    )
  )
)
```

```

        ;; Optional symbol instances for other `project`...
    )
)
...

```

- <1> The `xref:../sexpr-intro/index.adoc#_library_identifier[LIBRARY_IDENTIFIER]` defines which symbol in the `<<_library_symbol_section,library symbol section>>` of the schematic that this schematic symbol references.
- <2> The `POSITION_IDENTIFIER` defines the `xref:../sexpr-intro/index.adoc#_position_identifier[X and Y coordinates and angle of rotation]` of the symbol.
- <3> The ``unit`` token attribute defines which unit in the symbol library definition that the schematic symbol represents.
- <4> The ``in_bom`` token attribute determines whether the schematic symbol appears in any bill of materials output.
- <5> The ``on_board`` token attribute determines if the footprint associated with the symbol is exported to the board via the netlist.
- <6> The `UNIQUE_IDENTIFIER` defines the `xref:../sexpr-intro/index.adoc#_universally_unique_identifier[universally unique identifier]` for the symbol. This is used to map the symbol the `<<_symbol_instance_section,symbol instance information>>`.
- <7> The `PROPERTIES` section defines a list of `xref:../sexpr-intro/index.adoc#_symbol_property[symbol properties]` of the schematic symbol.
- <8> The ``pin`` token attributes define ???.
- <9> The ``instances`` token defines a list of symbol instances grouped by project. Every symbol will have a least one instance.
- <10> The ``project`` token attribute defines the name of the project to which the instance data belongs. There can be instance data from other project when schematics are shared across multiple projects. The projects will be sorted by the ``PROJECT_NAME`` in alphabetical order.
- <11> The ``path`` token attribute is the `<<_instance_path,path to the sheet instance>>` for the instance data.
- <12> The ``reference`` token attribute is a string that defines the reference designator for the symbol instance.
- <13> The ``unit`` token attribute is a integer ordinal that defines the symbol unit for the symbol instance. For symbols that do not define multiple units, this will always be 1.

== Hierarchical Sheet Section

The ``sheet`` token defines a hierarchical sheet of the schematic.

...

```
(sheet
  POSITION_IDENTIFIER <1>
  (size WIDTH HEIGHT) <2>
  [(fields_autoplaced)] <3>
  STROKE_DEFINITION <4>
  FILL_DEFINITION <5>
  UNIQUE_IDENTIFIER <6>
  SHEET_NAME_PROPERTY <7>
  FILE_NAME_PROPERTY <8>
  HIERARCHICAL_PINS <9>
  (instances <10>
    (project "PROJECT_NAME" <11>
      (path "PATH_INSTANCE" <12>
        (page "PAGE_NUMBER") <13>
      )
    )
    ;; Optional sheet instances for this `project`...
  )
  ;; Optional sheet instances for other `project`...
)
)
```

...

<1> The POSITION_IDENTIFIER defines the

xref:../sexpr-intro/index.adoc#_position_identifier[X and Y coordinates and angle of rotation]
of the sheet in the schematic.

<2> The ``size`` token attributes define the WIDTH and HEIGHT of the sheet.

<3> The optional ``fields_autoplaced`` token indicates if the properties have been automatically placed.

- <4> The STROKE_DEFINITION defines how the sheet
- xref:../sexpr-intro/index.adoc#_stroke_definition[outline is drawn].
- <5> The FILL_DEFINITION defines how the sheet is
- xref:../sexpr-intro/index.adoc#_fill_definition[filled].
- <6> The UNIQUE_IDENTIFIER defines the
- xref:../sexpr-intro/index.adoc#_universally_unique_identifier[universally unique identifier]
- for the sheet. This is used to map the sheet
- <<_symbol_instance_section,symbol instance information>> and
- <<_hierarchical_sheet_instance_section,sheet instance information>>.
- <7> The SHEET_PROPERTY_NAME is a xref:../sexpr-intro/index.adoc#_symbol_property[property] that
- defines the name of the sheet. This property is mandatory.
- <8> The FILE_NAME_PROPERTY is a xref:../sexpr-intro/index.adoc#_symbol_property[property] that
- defines the file name of the sheet. This property is mandatory.
- <9> The HIERARCHICAL_PINS section is a list of
- <<_hierarchical_sheet_pin_definition, hierarchical pins>> that map a
- <<_hierarchical_label_section,hierarchical label>> defined in the associated schematic file.
- <10> The `instances` token defines a list of sheet instances grouped by project. Every sheet
- will have a least one instance.
- <11> The `project` token attribute defines the name of the project to which the instance data
- belongs. There can be instance data from other project when schematics are shared across
- multiple projects. The projects will be sorted by the `PROJECT\_NAME` in alphabetical order.
- <12> The `path` token attribute is the <<_instance_path,path to the sheet instance>> for the
- sheet instance data.
- <13> The `page` token attribute is a string that defines the page number for the sheet instance.

=== Hierarchical Sheet Pin Definition

The `pin` token in a <<_hierarchical_sheet_section,sheet>> object defines an electrical connection between the sheet in a schematic with the <<_hierarchical_label_section,hierarchical label>> defined in the associated schematic file.

...

```
(pin
  "NAME"                                     <1>
  input | output | bidirectional | tri_state | passive    <2>
```

```

        POSITION_IDENTIFIER                                <3>
        TEXT_EFFECTS                                     <4>
        UNIQUE_IDENTIFIER                                <5>
    )
    ...

```

- <1> The "NAME" attribute defines the name of the sheet pin. It must have an identically named <<_hierarchical_label_section,hierarchical label>> in the associated schematic file.
- <2> The electrical connect type token defines the type of electrical connect made by the sheet pin.
- <3> The POSITION_IDENTIFIER defines the
xref:../sexpr-intro/index.adoc#_position_identifier[X and Y coordinates and angle of rotation]
of the pin in the sheet.
- <4> The TEXT_EFFECTS section defines how the
xref:../sexpr-intro/index.adoc#_text_effects[pin name text is drawn].
- <5> The UNIQUE_IDENTIFIER defines the
xref:../sexpr-intro/index.adoc#_universally_unique_identifier[universally unique identifier]
for the pin.

== Root Sheet Instance Section

```

    ...

    (path
        "/"                                                <1>
        (page "PAGE")                                       <2>
    )
    ...

```

- <1> The instance path is always empty ("/") since there are no sheets pointing to the root sheet.
- <2> The `page` token defines the page number of the root sheet. Page numbers can be any valid string.

title: Symbol Library File Format

weight: 44

:TOC:

.Summary The s-expression symbol library file format.

<!--more-->

== Introduction

This documents the s-expression symbol library file format for all versions of KiCad from 6.0.

* Symbol library files use the `.kicad\_sym` extension.

* Symbol library files can define one or more symbols.

== Layout

A symbol library file includes the following sections:

* <<_header_section,Header>>

* <<_symbol_section,Symbol Definition>>

== Header Section

The `kicad\_symbol\_lib` token indicates that it is KiCad symbol library file. This section is required.

NOTE: Third party scripts should not use `kicad\_symbol\_editor` as the generator identifier. Please use some other identifier so that bugs introduced by third party generators are

not confused with a footprint library file created by KiCad.

...

```
(kicad_symbol_lib
  (version VERSION)                <1>
  (generator GENERATOR)            <2>

  ;; contents of the symbol library file...  <3>
)
```

...

<1> The `version` token attribute defines the symbol library version using the YYYYMMDD date format.

<2> The `generator` token attribute defines the program used to write the file.

<3> The symbol definitions go here. Symbol library files can have zero or more symbols.

== Symbol Section

The `symbol` token defines a symbol in the library.

...

```
[SYMBOL_DEFINITION]                <1>

...
```

...

<1> The xref:../sexpr-intro/index.adoc#_symbols[SYMBOL_DEFINITION] defines the symbol(s) in the library file.

Resumo: --- title: Work Sheet File Format weight: 46 --- :TOC: .Summary The s-expression work sheet file format. <!--more--> == Introduction This documents the s-expression work sheet file format for all versions of KiCad from 6.0. Work sheet files are used to change the default border a...

title: Work Sheet File Format

weight: 46

:TOC:

.Summary The s-expression work sheet file format.

<!--more-->

== Introduction

This documents the s-expression work sheet file format for all versions of KiCad from 6.0. Work sheet files are used to change the default border and title block for schematics and boards.

* Work sheet files use the ``.kicad_wks`` extension.

=== Work Sheet Coordinates

* The minimum internal unit for work sheet files is 1 micrometer so there is maximum resolution of three decimal places or 0.001 mm. Any precision beyond three places will be truncated.

=== Object Incrementing

All graphical objects can be drawn multiple times with a given repeat count and X and/or Y incremental distances. The direction of the increment is controlled by defining a start corner and/or end corner depending on the graphical object type. The table below defines the corner tokens and their meaning.

```
[options=header,cols="1,3"]
```

```
|===
```

```
| Token| Description
```

```
| ltcorner| Top left corner of the start or end point.
```

```
| lbcorner| Bottom left corner of the start or end point.
```

```
| rbcorner| Bottom right corner of the start or end point.
```

```
| rtcorner| Top right corner of the start or end point.
```

```
|===
```

```
== Layout
```

A work sheet file includes the following sections:

```
* <<_header_section,Header>>
```

```
* <<_set_up_section,Set Up Section>>
```

```
* <<_drawing_object_section,Drawing Object Section>>
```

```
== Header Section
```

The `kicad\_wks` token indicates that it is KiCad work sheet file. This section is required.

NOTE: Third party scripts should not use `pl\_editor` as the generator identifier. Please use some other identifier so that bugs introduced by third party generators are not confused with a work sheet file created by KiCad.

```
...
```

```
(kicad_wks  
(version VERSION)
```

```
<1>
```

```
(generator GENERATOR)
```

```
<2>
```

```
;; contents of the schematic file...
```

```
<3>
```

```
)
```

```
...
```

<1> The `version` token attribute defines the work sheet version using the YYYYMMDD date format.

<2> The `generator` token attribute defines the program used to write the file.

<3> The work sheet sections go here.

== Set Up Section

The ``setup`` token defines the configuration information for the work sheet.

```
...  
  
(setup  
  (textsize WIDTH HEIGHT)           <1>  
  (linewidth WIDTH)                 <2>  
  (textlinewidth WIDTH)             <3>  
  (left_margin DISTANCE)            <4>  
  (right_margin DISTANCE)           <5>  
  (top_margin DISTANCE)             <6>  
  (bottom_margin DISTANCE)          <7>  
)  
...
```

<1> The ``textsize`` token attributes define the default WIDTH and HEIGHT of text.

<2> The ``linewidth`` token attribute defines the default WIDTH of lines.

<3> The ``textlinewidth`` token attribute define the default WIDTH of the lines used to draw text.

<4> The ``left_margin`` token attributed defines the DISTANCE from the left edge of the page.

<5> The ``right_margin`` token attributed defines the DISTANCE from the right edge of the page.

<6> The ``top_margin`` token attributed defines the DISTANCE from the top edge of the page.

<7> The ``bottom_margin`` token attributed defines the DISTANCE from the bottom edge of the page.

== Drawing Object Section

The drawing object section can contain zero or more `<<_title_block_text,title block text>>`,

`<<_graphical_line,graphical line>>`, `<<_graphical_rectangle,graphical rectangle>>`,

`<<_graphical_polygon,graphical polygon>>`, or `<<_image,image>>`. The objects are ordered

as they are added to the work sheet.

=== Title Block Text

The `tbtext` token attributes define text used in the title block of a work sheet.

...

```
(tbtext
  "TEXT"                                <1>
  (name "NAME")                         <2>
  (pos X Y [CORNER])                   <3>
  (font [(size WIDTH HEIGHT)] [bold] [italic]) <4>
  [(repeat COUNT)]                     <5>
  [(incrx DISTANCE)]                   <6>
  [(incry DISTANCE)]                   <7>
  [(comment "COMMENT")]                <8>
)
```

...

<1> The `tbtext` token attribute defines the TEXT string.

<2> The `name` token attribute defines the NAME of the text object.

<3> The `pos` token attributes define the X and Y coordinates the text. The optional CORNER attribute is used to define the <<_object_incrementing,initial corner>> for repeating incremental text.

<4> The `font` token attributes define how the text is drawn. The optional `size` token attributes define the size of the font used to draw the text. If not defined, the default text size defined in the <<_set_up_section,set up section>> is used. The optional `bold` token indicates the text be drawn with a bold font. The optional `italic` token indicates the text be drawn italicized.

<5> The optional `repeat` token attribute defines the COUNT for repeated incremental text.

<6> The optional `incrx` token attribute defines the repeat DISTANCE on the X axis.

<7> The optional `incry` token attribute defines the repeat DISTANCE on the Y axis.

<8> The optional `comment` token attribute is a comment for the text object.

=== Graphical Line

The `line` token attributes define how a line is drawn in the work sheet.

...

```
(line
```

```

    (name "NAME")                                <1>
    (start X Y [CORNER])                          <2>
    (end X Y [CORNER])                            <3>
    [(repeat COUNT)]                             <4>
    [(incrx DISTANCE)]                           <5>
    [(incry DISTANCE)]                           <6>
    [(comment "COMMENT")]                        <7>
  )
...

```

<1> The `name` token attribute defines the NAME of the line object.

<2> The `start` token attributes define the X and Y coordinates of the start point of the line.
The optional CORNER attribute defines the <<_object_incrementing,initial corner>> for repeating incremental lines.

<3> The `end` token attributes define the X and Y coordinates of the end point of the line.
The optional CORNER attribute defines the <<_object_incrementing,end corner>> for repeating incremental lines.

<4> The optional `repeat` token attribute defines the COUNT for repeated incremental lines.

<5> The optional `incrx` token attribute defines the repeat DISTANCE on the X axis.

<6> The optional `incry` token attribute defines the repeat DISTANCE on the Y axis.

<7> The optional `comment` token attribute is a comment for the line object.

=== Graphical Rectangle

The `rect` token attributes define how a rectangle is drawn in the work sheet.

```

...

(rect
  (name "NAME")                                <1>
  (start X Y [CORNER])                          <2>
  (end X Y [CORNER])                            <3>
  [(repeat COUNT)]                             <4>
  [(incrx DISTANCE)]                           <5>
  [(incry DISTANCE)]                           <6>
  [(comment "COMMENT")]                        <7>
)

```

```

)
...
<1> The `name` token attribute defines the NAME of the rectangle object.
<2> The `start` token attributes define the X and Y coordinates of the start point of the
      rectangle. The optional CORNER attribute defines the <<_object_incrementing,initial corner>>
      for repeating incremental rectangles.
<3> The `end` token attributes define the X and Y coordinates of the end point of the rectangle.
      The optional CORNER attribute defines the <<_object_incrementing,end corner>> for repeating
      incremental rectangles.
<4> The optional `repeat` token attribute defines the COUNT for repeated incremental rectangles.
<5> The optional `incrx` token attribute defines the repeat DISTANCE on the X axis.
<6> The optional `incry` token attribute defines the repeat DISTANCE on the Y axis.
<7> The optional `comment` token attribute is a comment for the rectangle object.

```

=== Graphical Polygon

The `polygon` token defines a graphical polygon. This section will not exist if there are no polygons in the work sheet.

```

...
(
  (polygon
    (name "NAME") <1>
    (pos X Y [CORNER]) <2>
    [(rotate ANGLE)] <3>
    [(linewidth WIDTH)] <4>
    COORDINATE_POINT_LIST <5>
    [(repeat COUNT)] <6>
    [(incrx DISTANCE)] <7>
    [(incry DISTANCE)] <8>
    [(comment "COMMENT")] <9>
  )
)
...

```

```

<1> The `name` token attribute defines the NAME of the polygon object.
<2> The `pos` token attributes define the X and Y coordinates the text. The optional CORNER

```

attribute is used to define the <<_object_incrementing,initial corner>> for repeating incremental polygons.

<3> The optional `rotate` token attribute defines the rotation angle of the polygon object.

<4> The optional `linewidth` token attribute defines the width of all of the polygons. If not defined, the default line width in the <<_set_up_section,set up section>> is used.

<5> The COORDINATE_POINT_LIST defines the list of
xref:../sexpr-intro/index.adoc#_coordinate_point_list[X/Y coordinates] of to draw line(s) between. A minimum of two points is required.

<6> The optional `repeat` token attribute defines the COUNT for repeated incremental polygons.

<7> The optional `incrx` token attribute defines the repeat DISTANCE on the X axis.

<8> The optional `incry` token attribute defines the repeat DISTANCE on the Y axis.

<9> The optional `comment` token attribute is a comment for the polygon object.

=== Image

The `image` token defines one or more embedded images. This section will not exist if no images are in the work sheet.

...

```
(bitmap
  (name "NAME") <1>
  (pos X Y ) <2>
  (scale SCALAR) <3>
  [(repeat COUNT)] <4>
  [(incrx DISTANCE)] <5>
  [(incry DISTANCE)] <6>
  [(comment "COMMENT")] <7>
  (pngdata IMAGE_DATA) <8>
)
```

...

<1> The `name` token attribute defines the NAME of the image.

<2> The `pos` token attributes define the X and Y coordinates of the image. The optional CORNER attribute defines the <<_object_incrementing,start corner>> for repeating incremental images.

- <3> The ``scale`` token attribute defines the `SCALE_FACTOR` of the image.
- <4> The optional ``repeat`` token attribute defines the `COUNT` for repeated incremental image.
- <5> The optional ``incrx`` token attribute defines the repeat `DISTANCE` on the X axis.
- <6> The optional ``incry`` token attribute defines the repeat `DISTANCE` on the Y axis.
- <7> The optional ``comment`` token attribute is a comment for the image object.
- <8> The ``pngdata`` token attribute defines the `<<_image_data,IMAGE_DATA>>` in the https://en.wikipedia.org/wiki/Portable_Network_Graphics[portable network graphics format (PNG)].

==== Image Data

The ``data`` token defines the raw image data.

```
...  
  
    (data XX1 ... XXN )                                <1>  
  
    ...  
...
```

- <1> The ``data`` token attributes define the hexadecimal byte data separated by a space. A maximum of 32 bytes will be defined for each ``data`` token. The ``data`` tokens are defined until all of the image data is defined.

== Contributing to KiCad (application) development

=== Developer mailing list

The first thing to do before anything is to join the

link:https://groups.google.com/a/kicad.org/g/devlist[KiCad Developers Mailing List].

Here you can ask broad questions and present your ideas or plans if it's beyond a bug fix.

=== Obtaining the code

KiCad uses link:https://git-scm.com/book/en/v2/Getting-Started-What-is-Git[Git]

for source control.

If you are new to git, it is highly suggested you

find and follow the many tutorials available online like

link:http://learngitbranching.js.org/[this one]

and/or read the git link:https://git-scm.com/doc[documentation].

We also are dedicated to using GitLab as our primary hosting platform for our Git repositories. All repos can be found <https://gitlab.com/kicad/>[here].

The repository for the main application can be found <https://gitlab.com/kicad/code/kicad/>[here]

=== Compiling the code

Follow the instruction in the link:../build/[documentation] corresponding to your platform to set up a working build environment and successfully build KiCad from source.

=== Code Documentation

To familiarize yourself with the code base you can read the documentation generated by Doxygen. When submitting new code, please remember to update the documentation descriptions. You can run ``make doxygen-docs`` to generate the documentation locally.

The latest version of the same docs are also available on the Jenkins server, see

link:<http://docs.kicad.org/doxygen/namespaces.html>[KiCad Developer Docs for the {cpp} API].

You can also find various developer notes in the Doxygen docs, see

link:<http://docs.kicad.org/doxygen/pages.html>[the related pages].

=== Before you submit

After you make changes, please ensure your code meets the link:../rules-guidelines/code-style/[KiCad Coding Style Policy]. Your commit messages should follow the rules stated in the link:../rules-guidelines/commit/[KiCad Commit Message Format Policy]

If you feel like working on the user interface, you will find useful reading the link:../rules-guidelines/ui/[User Interface Guidelines].

It's important for us to keep the codebase readable by all developers. Your patches will not be accepted until they adhere to the rules set forth in these policies.

Programming is an iterative process, don't worry if you have to go back and make changes to your patches,
=== Submitting the code
All patches should be submitted as a **merge request** on GitLab.

See this https://docs.gitlab.com/ee/user/project/merge_requests/creating_merge_requests.html[How to create merge requests]

*Note: There is a GitHub mirror of KiCad but all pull requests are ignored, we only accept changes on GitLab

=== Fix any CI issues

The GitLab repository has Continuous Integration (CI) enabled. This means it automatically runs processing the code can compile to coding style policy.

You can find the status of the CI job on the merge request page and see its output. If you need help, you can ask for help on our [link:https://groups.google.com/a/kicad.org/g/devlist](https://groups.google.com/a/kicad.org/g/devlist) [mailing list].

== Starter / Beginner Patches

Don't have any ideas in general on what to do but want to help?

You might want to look into [link:++https://gitlab.com/kicad/code/kicad/issues?scope=all&utf8=%E2%9C%93&state=opened](https://gitlab.com/kicad/code/kicad/issues?scope=all&utf8=%E2%9C%93&state=opened)

Or for example if you are an macOS user, you might want to check the following

[link:++https://gitlab.com/kicad/code/kicad/issues?scope=all&utf8=%E2%9C%93&state=opened&label_name\[\]=macos](https://gitlab.com/kicad/code/kicad/issues?scope=all&utf8=%E2%9C%93&state=opened&label_name[]=macos)

== Help

If you encounter any problems with building or developing KiCad, you may ask for guidance on our [link:https://groups.google.com/a/kicad.org/g/devlist](https://groups.google.com/a/kicad.org/g/devlist) [mailing list]. If you prefer real-time communication, you may also ask on our [link:++https://discord.gg/xEPC8QXFnS++](https://discord.gg/xEPC8QXFnS) [unofficial developer help channel on Discord].

title: Anti-Patterns

weight: 11

summary: Anti-pattern guidelines for writing code for the KiCad project.

:toc:

== Introduction

The purpose of this document is to provide the guidelines for how **not** to write code for the KiCad project. Anti-patterns are code practices that seem to occur often but shouldn't. If your code contains any of these patterns, please fix them.

WARNING: Do not modify this document without the consent of the project leader.

All changes to this document require approval.

=== Bare Enumerations

Bare enums are declared like this

```
```c++
```

```
enum LAST_LAYOUT {
```

```
 NONE,
```

```
 ALIAS,
```

```
 PARENT
```

```
};
```

```
```
```

These are problematic

because they declare the simple keywords `NONE`, `ALIAS` and `PARENT` into the

global scope. These then clash with enums or worse, defines, that exist in other header or source files used in the project.

The solution is to use

[https://en.cppreference.com/w/cpp/language/enum#Scoped_enumerations\[scoped enums\]](https://en.cppreference.com/w/cpp/language/enum#Scoped_enumerations[scoped_enums]).

In this form, the enum is

```
```c++
enum class LAST_LAYOUT {
 NONE,
 ALIAS,
 PARENT
};

LAST_LAYOUT l = LAST_LAYOUT::NONE;

switch(l)
{
 case LAST_LAYOUT::NONE : std::cout << "NONE\n"; break;
 case LAST_LAYOUT::ALIAS : std::cout << "ALIAS\n"; break;
 case LAST_LAYOUT::PARENT : std::cout << "PARENT\n"; break;
}
```
```

=== Dereferencing Pointers

Dereferencing an invalid pointer almost always results in a crash. ****Never****

assume a pointer is valid. Even if the code in question has never crashed before, that doesn't mean that someone won't break something in the future. Use

assertions to help developers catch invalid pointers during development. Even better than assertions, you can use the

[link:++https://docs.wxwidgets.org/3.2/group__group__funcmacro__debug.html++](https://docs.wxwidgets.org/3.2/group__group__funcmacro__debug.html)[wxWidgets debugging macros] which can raise assertions on debug builds and gracefully handle run time issues in release builds. If you are concerned about pulling in [https://www.wxwidgets.org/\[wxWidgets\]](https://www.wxwidgets.org/[wxWidgets]) user interface code,

there are header only C++ assertion libraries available.

Avoid the temptation to silently hide potentially bad pointers. The following code:

```
```c++
void SomeFunction(SomeObject* somePointer)
{
 if(somePointer)
 {
 somePointer->DeReferencedMethod();
 }
}
```
```

should be replaced with:

```
```c++
void SomeFunction(SomeObject* somePointer)
{
 // This will trigger a wxWidgets assertion dialog in debug builds and silently
 // return in release builds which is far better than crashing.
 wxCHECK(somePointer, /* void */)

 somePointer->DeReferencedMethod();
}
```
```

=== wxUpdateUIEvent Abuse

Avoid using `link:++https://docs.wxwidgets.org/3.2/classwx\_update\_u\_i\_event.html++` [

``wxUpdateUIEvent``] for anything other than the methods provided by the event object.

Updating controls in a ``wxUpdateUIEvent`` handler will typically trigger other control

events that in turn will fire more `wxUpdateUIEvents` which results in an infinite event loop that can cause the user interface to become less responsive.

If you are not sure you are abusing ``wxUpdateUIEvent``, the advanced configuration setting ``UpdateUIEventInterval`` allows you to set the time in milliseconds which the update events are generated or -1 to disable all update events. If slowing or disabling the update events makes the user interface more responsive, a ``wxUpdateUIEvent`` handler is the problem.

=== Translating Partial Sentences

Never break an translated sentence into multiple ``_()`` tags. This prevents translations from understanding your intention and from creating grammatically correct sentences in languages other than English.

For example the following is incorrect:

```
```c++
ShowReport(_("Duplicate instances of ") + m_changeArray[j].NewRefDes);
...

```

This should be replaced by the following:

```
```c++
ShowReport( wxString::Format( _( "Duplicate instances of %s" ), m_changeArray[j].NewRefDes ) );
...

```

The new formulation allows a translator to move the object of the sentence. In the original formulation, the object (the ``NewRefDes`` string) would always appear at the end of the sentence, which may not be grammatically correct in non-English languages.

Similarly, do not break sentences into parts like this:

```
```c++
wxString verb = updateMode ? _("Update") : _("Change");
wxString warning = _("%s all items on the board?");

wxMessageBox(wxString::Format(warning, verb));
...

```

In English, the word `Update` is both a noun and a verb. Without context, the translator will not know which version to use. Additionally, it will not be clear to the translator that the `verb` string is used by the `warning` string as they will not appear together in the translation file.

Instead, we must write the sentences explicitly:

```
```c++
wxString msg = updateMode ? _( "Update all items on the board?" ) :
                             _( "Change all items on the board?" );

wxMessageBox( msg );
...

```

=== Dialogs

==== Breaking Close Event Handling

Modal and Quasi-modal dialog windows closure is handled automatically when the standard button IDs (`wxID_OK`, `wxID_CANCEL`, `wxID_CLOSE`, etc.) as well as the close button title bar decorator. There is no need to handle [link:++https://docs.wxwidgets.org/3.2/classwx_close_event.html++](https://docs.wxwidgets.org/3.2/classwx_close_event.html)`[wxCloseEvent]` directly unless the dialog has special requirement such as vetoing the event. Very few dialogs require any special handling of close event. For more information see the [link:++https://docs.wxwidgets.org/3.2/overview_windowdeletion.html#overview_windowdeletion_close++](https://docs.wxwidgets.org/3.2/overview_windowdeletion.html#overview_windowdeletion_close++)`[wxWidgets closing windows documentation]`. If you do not fully understand the default dialog close event handling, do not implement one in your dialog. Doing so will most likely break the default handling.

==== Avoid Direct Access of Parent

Avoid passing a specific parent window pointer type to the dialog and saving it for use dialog methods. At best, this is a bad coding practice as it limits the re-usability of the dialog to a given parent window type. At worst, it can

cause crashes in <<_mode_less_dialogs,mode-less dialog windows>> when accessing the point in the dialog object destructor.

If you need to pass information to the parent window, use the

link:++https://docs.wxwidgets.org/3.2/overview_events.html++[wxWidgets events] instead. This:

```
```c++
MY_DIALOG::MY_DIALOG(SCH_EDIT_FRAME* aParent)
{
 m_frame = aParent;
}

void MY_DIALOG::SomeMethod()
{
 m_frame->SomeFrameMethod();
}

...

```

should be replaced with this:

```
```c++
MY_DIALOG::MY_DIALOG( wxWindow* aParent )
{
}

void MY_DIALOG::SomeMethod()
{
    wxWindow* parent = GetParent();

    if( parent )
    {
        SOME_EVENT evt();

        // If the parent doesn't handle this event it goes into the bit bucket.
    }
}

```

```

        parent->HandleWindowEvent( evt );
    }
}
...

```

==== Object Property Modifiers

Modal and Quasi-modal dialog windows should be implemented as simple object property modifiers. Avoid modifying properties of live objects. Make a copy of the object being modified to transfer property information between the dialog controls and the object properties.

```

...C++

MY_DIALOG::MY_DIALOG( wxWindow* aParent, const LIB_PIN& aPin )
{
    m_pinCopy( m_Pin );    // Make a copy of the LIB_PIN object to modify.
}
...

```

==== Handling the OK Button

Dismissing a modal or quasi-modal dialog window by clicking on the "OK" button does not indicate that any of the object properties have been changed. Always compare the properties from the dialog object against the properties of the original object. Only set the document modified flag if the object properties have been modified.

```

...C++

MY_DIALOG dlg( this, m_somePin );
if( dlg.ShowQuasiModal() == wxID_OK && dlg.GetPin() != m_somePin )
{
    // Update the undo/redo handling here.

    m_somePin = dlg.GetPin();
    // Set modified flag here.
}

```

...

==== Mode Specific Coding

Avoid adding mode specific code to dialogs. The dialog cannot know how it is going to be shown in advance. Making assumptions about how the dialog is shown from within the dialog can lead to unexpected bugs.

```C++

```
void MY_DIALOG::OnCloseEvent(wxCloseEvent& aEvent)
{
 // The code will clean up the dialog when it is mode-less but it also will
 // completely bypass the automatic data transfer handling for modal and
 // quasi-modal dialogs.
 Destroy();
}
...

```

#### ==== Mode-less Dialogs

##### ===== Memory Management

[https://www.wxwidgets.org/\[wxWidgets\]](https://www.wxwidgets.org/[wxWidgets]) mode-less dialogs are always created on the heap using the C++ `new` operator. Therefore, it is the developers responsibility to manage the memory allocated for the dialog. However, [https://www.wxwidgets.org/\[wxWidgets\]](https://www.wxwidgets.org/[wxWidgets]) windows object memory should never be cleaned up using the C++ `delete` operator. [https://www.wxwidgets.org/\[wxWidgets\]](https://www.wxwidgets.org/[wxWidgets]) provides the [https://docs.wxwidgets.org/3.2/classwx\\_window.html#a6bf0c5be864544d9ce0560087667b7fc](https://docs.wxwidgets.org/3.2/classwx_window.html#a6bf0c5be864544d9ce0560087667b7fc)[Destroy] method to perform any required window tear down and then deletes the allocated memory.

##### ===== Dialog Life Time

[https://www.wxwidgets.org/\[wxWidgets\]](https://www.wxwidgets.org/[wxWidgets]) does **not** guarantee that a parent window will out live a mode-less dialog created by it. Therefore, attempting to access the parent window from

the dialog's destructor <<\_avoid\_direct\_access\_of\_parent, (See Avoid Direct Access of Parent)>> may crash. If you have to access the parent from the the dialog destructor, check to make sure the dialog has been shown in either the modal or quasi-modal mode.

Don't do this:

```
```c++
MY_DIALOG::~MY_DIALOG()
{
    m_parent->SomeParentWindowMethod(); // May crash if the dialog is mode-less.
}
...

```

instead do this:

```
```c++
MY_DIALOG::~MY_DIALOG()
{
 // Ensures the parent is still valid.
 if(IsModal() || IsQuasiModal()
 m_parent->SomeParentWindowMethod();
}
...

```

=== S-Expression File Format Anti-patterns

==== Unquoted strings

Always quote strings in KiCad file formats, whether or not they contain user-generated data or you think they might need to be quoted.

```
...

// Do this
(generator "eeschema")
// Not this (assuming that 'eeschema' is not a token)
(generator eeschema)

```

...

#### ==== Non-standard boolean flags

Use the tokens `yes` and `no` for booleans in the file format. All boolean flags should be a two-element list of the form `(token [yes|no])`. Do not use implicit-true booleans. Boolean flags may be omitted from formatting where it makes sense to do so (and the parser should have a defined default value that will be assumed if the flag is missing), but if the boolean token is present, an explicit value must also be present.

...

// Do this

```
(my_item
 (hide yes)
)
```

// Or this

```
(my_item
 (show no)
)
```

// Not this (an implicitly-true boolean)

```
(my_item
 (hide)
)
```

// And not this (a boolean outside an enclosing list)

```
(my_item hide yes)
```

...

#### ==== Ignoring unneeded or deprecated tokens implicitly

When implementing a parser that needs to skip over tokens in a file that are not needed, always do so explicitly, by parsing the tokens and doing nothing with them. Do not do this implicitly by

skipping a certain number of symbols.

```
```c++
// Do this

for( token = NextTok(); token != T_RIGHT && token != EOF; token = NextTok() )
{
    if( token == T_LEFT )
        token = NextTok();

    switch( token )
    {
    case T_generator:
        // Skip (generator "generatorname")
        NeedSYMBOL();
        NeedRIGHT();
        break;
    //...
    }
}

// Don't do this

for( token = NextTok(); token != T_RIGHT && token != EOF; token = NextTok() )
{
    if( token == T_LEFT )
        token = NextTok();

    switch( token )
    {
    case T_version:
        m_requiredVersion = parseInt( FromUTF8().mb_str( wxConvUTF8 ) );
        NeedRIGHT();

        // Skip (generator "generatorname")
        NeedLEFT();
        NeedSYMBOL();
    }
}
```

```

        NeedSYMBOL();

        NeedRIGHT();

        break;

    //...

}

}

...

```

=== Formatting & Parsing

==== Formatting

Dealing with locale is terrible and ineffiecient.

When writing output for a file, avoid the use of ``printf``, both the libc implementation and relatives like

Instead, utilize the `{fmt}` library which provides locale-neutral formatting of floats and is far more per

```

...

double x,y;

fmt::print( m_file, "ORIGIN {} {}", x, y );

...

```

An additional benefit of ``fmt::print`` when used with a `FILE*` handle (optional), is its ability to throw ex

IO activity. This simplifies error handling to a top-level try/catch block instead of needing to check ev

==== Parsing

When parsing files, avoid the use of ``strtod``. ``strtod`` is dependent on the locale for correct parsing. Instead utilize ``fast_float::from_char``, the ``fast_float::chars_format::skip_white_space`` option for the c

can be used to give it compatibility with `strtod`'s whitespace skipping ability.

```

...

double                dval{};

fast_float::from_chars_result res = fast_float::from_chars( str.data(), str.data() + str.size(), dval,

fast_float::chars_format::skip_white_space

```

...

`std::from_char` should not be used for doubles. It is not available in macOS libc++ unlike Linux and Windows. fast_float::from_char in benchmarking is also about 2-3x faster than std::from_char.`

title: Code Design Guidelines

weight: 5

summary: The code design guidelines are rules that must be met for any
contribution to KiCad's application code base.

:toc:

== 1. Introduction

The purpose of this document is to provide a guide for KiCad developers about source code dos and don'ts in KiCad. It is not a comprehensive guide because it does not cover all topics. However, it is expected that all of the topics covered by this document are followed by all developers contributing code to the KiCad project.

== 2. Library Dependencies

KiCad is a cross platform project. Therefore, all dependency libraries must be packaged for all

[https://www.kicad.org/help/system-requirements/\[supported platforms\]](https://www.kicad.org/help/system-requirements/[supported platforms]).

If packages are not available on a given platform, it is the responsibility of the developer introducing any new dependencies to ensure that they are packaged before submitting the new dependency. Platform specific features will not be accepted.

== 3. Low Level Object Design

All KiCad low level objects not directly related to user interface design must be free of user interface code dependencies. This includes all `SCH\_\*`, `LIB\_\*`,

``PCB_*`, `FP_*`, and I/O plugin objects.`

`:link-with-underscores: https://docs.wxwidgets.org/3.0/group\_\_group\_\_funcmacro\_\_debug.html`

NOTE: The only exception is the `{link-with-underscores}[wxWidgets Debugging Macros]`.

The reason for this is that the wxWidgets user interface code is only used in debug builds. This has the advantage of developers being made aware of coding issues without having to run from the command line or in a debugger to see assertion messages.

title: Code Style Policy

weight: 2

summary: The code style guidelines that must be met for any contribution to
KiCad's application codebase.

:toc:

== 1. Introduction

The purpose of this document is to provide a reference guide for KiCad developers about how source code should be styled and formatted in KiCad. It is not a comprehensive programming guide because it does not discuss many things such as software engineering strategies, source directories, existing classes, or how to internationalize text. The goal is to make all of the KiCad source conform to this guide.

== 1.1 Why Coding Style Matters

You may be thinking to yourself that using the style defined in this document will not make you a good programmer and you would be correct. Any given coding style is no substitute for experience. However, any experienced coder will tell that the only thing worse than looking at code that is not in your preferred coding style, is looking at twenty different coding styles that are not your preferred coding style. Consistency makes a) problems easier to spot, and b) looking at code for long periods of time more tolerable.

== 1.2 Enforcement

The KiCad coding police are not going to break down your door and beat you with your keyboard if you don't follow these guidelines (although there are those who would argue that they should). However, there are

some very sound reasons why you should follow them. If you are contributing patches, you are much more likely to be taken seriously by the primary developers if your patches are formatted correctly. Busy developers don't have the time to go back and reformat your code. If you have a desire to become a regular KiCad developer with commit access to the development branch, you're not likely to get a glowing recommendation by the lead developers if you will not follow these guidelines. It is just good programming courtesy to follow this policy because it is respectful of the investment already made by the existing developers. The other KiCad developers will appreciate your effort.

****Warning****

****Do not modify this document without the consent of the project leader. All changes to this document require approval.****

== 1.3 Tools

There are some tools that can help you format your code easily.

<https://clang.llvm.org/docs/ClangFormat.html>[clang-format] is a formatting tool that can both be used to provide code-style automation to your editor of choice, as well as allow git to check formatting when committing (using a "Git hook"). You should install this program to be able to use the Git hooks.

The style config file is ``_clang-format``, and should be picked up automatically by ``clang-format`` when the ``--style=file`` option is set.

To enable the Git hooks (only needs to be done once per Git repo):
[source,bash]

```
git config core.hooksPath .githooks
```

Set the ``git clang-format`` tool to use the provided ``_clang-format`` file:

```
[source,bash]
```

```
----
```

```
git config clangFormat.style file
```

```
----
```

Then, to enable the format checker, set the `kicad.check-format` Git config to "true" for the KiCad repo:

```
[source,bash]
```

```
----
```

```
git config kicad.check-format true
```

```
----
```

Without this config, the format checker will not run on commit, but you can still check files staged for commit manually (see below).

If the hook is enabled, when you commit a change, you will be told if you have caused any style violations (only in your changed code). You can then fix the errors, either manually, or with the tools below.

If you are warned about formatting errors, but you are sure your style is correct, you can still commit:

```
[source,bash]
```

```
----
```

```
git commit --no-verify
```

```
----
```

=== 1.3.1 Correcting Formatting Errors

There is a Git aliases file that provides the right commands to show and correct formatting errors. Add to your repository config by running this command from

the source directory:

```
[source,bash]
```

```
----
```

```
git config --add include.path $(pwd)/tools/git/format_alias
```

Then you can use the following aliases:

- * ``git check-format``: show any formatting warnings (but make no changes)
- * ``git fix-format``: correct formatting (you will need to ``git add`` afterwards)

These aliases use a script, ``tools/check_coding.sh``, which takes care of only checking the formatting for files that should be formatted. This script has other uses:

- * Make (or see only) violations in files modified in the previous commit (useful when interactive-rebasing):

```
* `check_coding.sh --amend [--diff]`  
== 2. Naming Conventions
```

Before delving into anything as esoteric as indentation and formatting, naming conventions need to be addressed. This section does not attempt to define what names you use for your code. Rather, it defines the style for naming. See the references section for links to some excellent coding references. When defining multiple word names use the following conventions for improved readability:

- Use underscores for all upper and all lower case variables to make multiple word names more readable.
- Use camel case for mixed case variable names.

Avoid mixing camel case and underscores.

****Examples****

```
CamelCaseName          // if camelcase, then no underscores  
  
all_lower_case_name  
  
ALL_UPPER_CASE_NAME
```

=== 2.1 Class, Type Definitions, Name Space, and Macro Names

Class, typedef, enum, name space, and macro names should be comprised of all capital letters.

****Examples****

[source,cpp]

```
-----  
  
    class SIMPLE  
  
    #define LONG_MACRO_WITH_UNDERSCORES  
  
    typedef boost::ptr_vector<PIN>      PIN_LIST;  
  
    enum KICAD_T {...};  
  
-----
```

=== 2.2 Local, Private and Automatic Variables

The first character of automatic, static local, and private variable names must be lower case. This indicates that the variable will not be “visible” outside of the function, file, or class where they are defined, respectively. The limited visibility is being acknowledged with the lowercase starting letter, where lowercase is considered to be less boisterous than uppercase.

****Examples****

[source,cpp]

```
-----  
  
    int i;  
  
    double aPrivateVariable;  
  
    static char* static_variable = NULL;  
  
-----
```

Private class and struct members must be prefixed with ``m_`` and the first character after the ``m_`` prefix must also be lowercase:

[source,cpp]

```
-----  
private:
```

```
int m_privateData;
```

=== 2.3 Public and Global Variables

The first character of public and global variable names must be uppercase. This indicates that the variable is visible outside the class or file in which it was defined. (An exception is the use of prefix ``g_`` which is also sometimes used to indicate a global variable.)

****Example****

[source,cpp]

```
char* GlobalVariable;
```

In general, classes should not use public member variables, and instead should use getter/setter methods to access private members. The exception is classes that are essentially data structures with some helper methods. For example, the ``SEG`` class is used frequently as a data structure representing a line segment between two points. This class has public member variables ``A`` and ``B`` storing those points. This is acceptable because the ``SEG`` class meets that definition of being essentially a data structure, and because there is no need for side-effects when changing ``A`` or ``B``.

=== 2.4 Local, Private and Static Functions

The first character of local, private, and static functions should be lower case. This indicates that the function is not visible outside the class or file where it is defined.

****Example****

[source,cpp]

```
bool isModified();
```

```
static int buildList( int* list );
```

=== 2.5 Function Arguments

Function arguments are prefixed with an 'a' to indicate these are arguments to a function. The 'a' stands for "argument", and it also enables clever and concise Doxygen comments.

****Example****

[source,cpp]

```
----  
  
    /**  
     * Copy aFoo into this instance.  
     */  
  
    void SetFoo( int aFoo );  
  
----
```

Notice how the reader can say "a Foo" to himself when reading this.

=== 2.6 Pointers

It is not desired to identify a pointer by building a 'p' into the variable name. The pointer aspect of the variable pertains to type, not purpose.

****Example****

[source,cpp]

```
----  
  
    MODULE*    module;  
  
----
```

The purpose of the variable is that it represents a MODULE. Something like ``p_module`` would only make that harder to discern.

Use smart pointers where it makes sense to simplify memory management.

Where using smart pointers, the STL types ``std::shared_ptr`` / ``std::unique_ptr`` are preferred. Do not use Boost smart pointers.

=== 2.7 Accessing Member Variables and Member Functions

We do not use ``this->`` to access either member variables or member

functions from within the containing class. We let {cpp} perform this for us.

=== 2.8 Use of 'auto'

We do -not- use `auto` to reduce repetition. We do use it to increase readability. This generally means -only- use `auto` where `std::lib` gets overly verbose (such as iterators or `std::make_shared`), or when not using `auto` would cause line-wraps that can't otherwise be avoided.

****Example****

[source,cpp]

```
auto    board = m_frame->GetBoard();           // Not permitted, use the actual type name
BOARD*  board = m_frame->GetBoard();           // OK
auto    it    = someComplexSTLType.begin();    // OK, improves readability

for( auto& item : container )                  // Discouraged where the actual type name isn't very long
for( TYPE& item : container )                  // Preferred
for( auto& [key, value] : map )                // C++17 structured binding; acceptable when readable
----
```

=== 2.9 Casting

In most circumstances, use of C-style casting is not permitted. Explicit {cpp}-style casting should be used instead.

****Example****

[source,cpp]

```
PCB_TRACK* track = ( PCB_TRACK* )item;        // Not permitted
PCB_TRACK* track = static_cast<PCB_TRACK*>( item ); // OK (when used safely)
PCB_TRACK* track = dynamic_cast<PCB_TRACK*>( item ); // OK
```

== 3. Commenting

Comments in KiCad typically fall into two categories: in line code

comments and Doxygen comments. In line comments have no set formatting rules other than they should have the same indent level as the code if they do not follow a statement. In line comments that follow statements should not exceed 119 columns unless absolutely necessary. This prevents word wrapping in an editor when the viewable columns is set to 120. In line comments can use either the {cpp} or the C commenting style, but {cpp} comments are preferred for single line comments or comments consisting of only a few lines.

Avoid stating the obvious in comments. Adding a comment that states this is a dtor, ctor, function, iterator, etc. just adds noise to the comment. Any sufficiently experience developer can recognize this. Avoid comments that state what code does. It should be obvious what code does or it should be rewritten so that it is obvious.

=== 3.1 Blank Lines Above Comments

If a comment is the first thing on a line, then that comment should have one or more blank lines above them. One blank line is preferred.

=== 3.2 Doxygen

Doxygen is a {cpp} source code documenting tool used by the project. Descriptive *.html files can be generated from the source code by installing Doxygen and building the target named ****doxygen-docs****.

[source,sh]

```
...  
  
    cd <kicad_build_base>  
  
    make doxygen-docs  
  
...
```

The generated source *.html files will be placed into
<kicad_project_base>/Documentation/doxygen/html/.

Doxygen comments are used to build developer documentation from the source code. They should normally be only placed in header files (.h) and not in source files (.cpp). This eliminates the obligation to keep two comments

in agreement with each other. If the class, function, or enum, etc. is only defined in a source file and not present in any header file, in which case the Doxygen comments should go into the source file. Again, avoid duplicating the Doxygen comments in both the header and source files.

KiCad uses the JAVADOC comment style defined in the <http://www.doxygen.nl/manual/docblocks.html>`[doccode]` section of the Doxygen <http://www.doxygen.nl/manual/>`[manual]`. Don't forget to use the <https://www.doxygen.nl/manual/commands.html>`[special Doxygen tags]` : bug, todo, deprecated, etc., so other developers can quickly get useful information about your code. It is good practice to actually generate the Doxygen *.html files by building target doxygen-docs, and then to review the quality of your Doxygen comments with a web browser before submitting a patch.

Avoid defining class and function names and argument and return data types. This redundant information can easily be read by other developers and shows up as redundant information in the generated documentation.

NOTE: Many legacy Doxygen comments in KiCad start with the function name on a blank line before the rest of the comment. This style is no longer acceptable, and modifications to those legacy function signatures is a good opportunity to remove these lines from the Doxygen comments.

Use <https://www.doxygen.nl/manual/markdown.html>`[Doxygen's markdown]` syntax where possible instead of HTML tags. Markdown makes for more readable comments than mark up languages.

Use <https://www.doxygen.nl/manual/autolink.html>`[Doxygen links]` when referring to other code in Doxygen comments. This makes information easier to find for other developers.

Group related sections of comments together as much as possible using the <https://www.doxygen.nl/manual/grouping.html>`[Doxygen grouping commands]`. This makes finding related information easier than having it spread across

multiple document pages.

==== 3.2.1 Function Comments

These go into a header file, unless the function is a private (i.e. static) function known only to a source file. The format of a function comment is chosen to serve a dual purpose role: delineation of the function declaration within the source code and to create a consistent leading sentence in the Doxygen html output. The chosen format is to use a descriptive single line sentence, followed by a blank line, followed by an optional detailed description as the shown in the example below.

****Example****

[source,cpp]

```
----  
  
    /**  
     * Format and write text to an output stream.  
     *  
     * A really detailed description goes here if it's needed.  
     *  
     * @param aNestLevel is the multiple of spaces to precede the output with.  
     * @param aFmt is a printf() style format string.  
     * @param ... is a variable list of parameters that will get blended into  
     *   the output under control of the format string.  
     * @return the number of characters output.  
     * @throw IO_ERROR, if there is a problem outputting.  
     */  
  
    int PRINTF_FUNC Print( int aNestLevel, const char* aFmt, ... );  
  
----
```

The single line description goes on the 2nd line of the comment. The @return keyword if present, should describe the return value followed by a hyphen. The @param keyword names a function parameter and the text following should flow like a normal English sentence including proper punctuation.

==== 3.2.2 Class Comments

A class comment describes a class declaration by giving the purpose and

use of the class. Its format is similar to a function comment. Doxygen can use the html `\<p\>` (paragraph designation) to begin a new paragraph in its output. So if the text of the comment is large, break it put into multiple paragraphs as required.

****Example****

[source,cpp]

```
/**
 * An interface (abstract) class used to output UTF8 text in a
 * convenient way.
 *
 * The primary interface is "printf() like" but with support for
 * indentation control. The destination of the 8 bit wide text is
 * up to the implementer.
 *
 * <p>
 * The implementer only has to implement the write() function, but
 * can also optionally re-implement GetQuoteChar().
 *
 * <p>
 * If you want to output a wxString, then use CONV_TO_UTF8() on it
 * before passing it as an argument to Print().
 *
 * <p>
 * Since this is an abstract interface, only classes derived from
 * this one may actually be used.
 */
class OUTPUTFORMATTER
{
    ----
```

== 4. Formatting

This section defines the formatting style used in the KiCad source.

=== 4.1 Indentation

The indentation level for the KiCad source code is defined as four

spaces. Please do not use tabs.

==== 4.1.1 Defines

There should be only one space after a ``#define`` statement.

==== 4.1.2 Column Alignment

Please try to align multiple consecutive similar lines into consistent columns when possible, such as `#define` lines which can be thought of as containing 4 columns: ``#define``, symbol, value, and comment. Notice how all 4 columns are aligned in the example below.

[source,cpp]

```
-----  
  
    #define LN_RED      12      // my favorite  
  
    #define LN_GREEN    13      // eco friendly  
  
-----
```

Another common case is the declaration of automatic variables. These are preferably shown in columns of type and variable name.

=== 4.2 Blank Lines

==== 4.2.1 Function Declarations

There should be 1 blank line above a function declaration in a class file if that function declaration is presented with a Javadoc comment. This is consist with the statement above about blank lines above comments.

==== 4.2.2 Function Definitions

Function definitions in `*.cpp` files will not typically be accompanied by any comment, since those are normally only in the header file. It is desirable to set off the function definition within the `*.cpp` file by leaving two blank lines above the function definition.

==== 4.2.3 Control Statements

There should be one blank line before the opening statement and after

the closing curly brace or statement for all control statement blocks so that it is easy to see where control blocks begin and end. This includes ``if``, ``for``, ``while``, ``do``, and ``switch`` control blocks.

For example, a blank line is required here between the variable declaration and the ``if`` statement:

[source,cpp]

```
bool isTrue = checkSomething();
```

```
if( isTrue )
```

```
    doSomething();
```

Curly braces themselves count as blank lines for the purposes of this style rule. For example, a nested control statement may be written as:

[source,cpp]

```
while( aCondition )
```

```
{
```

```
    if( checkSomething() )
```

```
    {
```

```
        break;
```

```
    }
```

```
}
```

=== 4.3 Line Length

The maximum line width is 120 columns. An exception to this is a long quoted string such as the internationalized text required to satisfy MSV{cpp}, described below.

=== 4.4 Line-breaking Strings

The KiCad project team no longer supports compiling with Microsoft

Visual {cpp}. When you need to break long strings into smaller substrings, please use the C99 compliant method for improved readability. Using any of previously accepted methods defined below for breaking long internationalized strings will no longer be accepted.

****Examples****

[source,cpp]

```
// This works with C99 compliant compilers is the **only** accepted method:
```

```
wxChar* foo = _( "this is a long string broken "  
                 "into pieces for readability." );
```

```
// This works with MSVC, breaks POEdit, and is **not** acceptable:
```

```
wxChar* foo = _( "this is a long string broken "  
                 L"into pieces for readability" );
```

```
// This works with MSVC, is ugly, and is **not** accepted:
```

```
wxChar* foo = _( "this is a long string \  
broken into pieces for readability" );
```

A second acceptable solution is to simply put the text all on one line, even if it exceeds the 99 character line length limit. However, the preferred method is to break strings within the 99 character limit whenever possible to prevent wrapping.

=== 4.5 Line-breaking Expressions

When line breaking expressions the operators should appear at the beginning of a line, not at the end.

[source,cpp]

```
if( SomeMethodCall( some_parameter, other_parameter )  
    || some_local_variable == foo )
```

=== 4.6 Trailing Whitespace

Many programming editors conveniently indent your code for you. Some of them do it rather poorly and leave trailing whitespace. Thankfully, most editors come with a remove trailing whitespace macro or at least a setting to make trailing whitespace visible so you can see it and manually remove it. Trailing whitespace is known to break some text parsing tools. It also leads to unnecessary diffs in the version control system. Please remove trailing whitespace.

=== 4.7 Multiple Statements per Line

It is generally preferred that each statement be placed on its own line. This is especially true for statements without keywords.

[source,cpp]

```
x=1; y=2; z=3; // Bad, should be on separate lines.
```

=== 4.8 Braces

Braces should be placed on the line proceeding the keyword and indented to the same level. It is not necessary to use braces if there is only a single line statement after the keyword. In the case of if..else if..else, indent all to the same level.

[source,cpp]

```
void function()  
{  
    if( foo )  
    {  
        statement1;  
        statement2;  
    }  
}
```

```

        else if( bar )
        {
            statement3;

            statement4;
        }
        else
            statement5;
    }
----

```

Braces are required if the control statement spans more than one line, even if the control block is a single line. This makes it easier to visually parse.

[source,cpp]

```

----
    if( GetSomeProperty( parameter ) == SOME_CONSTANT_VALUE
        || GetSomeProperty( parameter ) == SOME_OTHER_CONSTANT_VALUE )
    {
        single_statement;
    }
----

```

=== 4.9 Parenthesis

Parenthesis should be placed immediately after function names and keywords. Spaces should be placed after the opening parenthesis, before the closing parenthesis, and between the comma and the next argument in functions. No space is needed if a function has no arguments.

[source,cpp]

```

----
    void Function( int aArg1, int aArg2 )
    {
        while( busy )
        {
            if( a || b || c )

```

```

        doSomething();
    else
        doSomethingElse();
}
}
----

```

=== 4.10 Switch Formatting

The case statement is to be indented to the same level as the switch.

[source,cpp]

```

----
switch( foo )
{
case 1:
    doOne();
    break;
case 2:
    doTwo();
    // Fall through.
default:
    doDefault();
}
----

```

It is preferred to place all cases on a single line when that makes the code more readable. This is often done for look-ups or mapping functions. In this case, you will have to manually align for readability as appropriate and reject clang-format's suggested changes, if you use it:

[source,cpp]

```

----
switch( m_orientation )
{
case PIN_RIGHT: m_orientation = PIN_UP;    break;

```

```

        case PIN_UP:    m_orientation = PIN_LEFT;  break;

        case PIN_LEFT:  m_orientation = PIN_DOWN;  break;

        case PIN_DOWN:  m_orientation = PIN_RIGHT; break;

    }
-----

```

=== 4.11 Lambdas

The braces and statements of the body should be indented as you would a method, with the braces lined up under the capture block:

[source,cpp]

```

-----

    auto belowCondition = []( const SELECTION& aSel )
    {
        return g_CurrentSheet->Last() != g_RootSheet;
    };

-----
or:

```

[source,cpp]

```

-----

    auto belowCondition =
    {
        []( const SELECTION& aSel )
        {
            return g_CurrentSheet->Last() != g_RootSheet;
        };
    };

-----

```

=== 4.12 Class Definition Layout

When defining classes, member variables should be placed at the bottom and methods should be placed above the member variables. The scope ordering of the class should be public, protect, then private. Do not redefine the same scope multiple times in a row. Here is an example

class definition:

[source,cpp]

```

-----

```

```

class F00
{
public:
    F00();

    void FooPublicMethod();

protected:
    void fooProtectedMethod();

private:
    void fooPrivateMethod();

    // Private not redefined here unless no private methods.
    int m_privateMemberVariable;
};
-----

```

=== 4.13 Getters and Setters

Class methods used to read and write from private class members without any other side effects are permitted to violate several of the normal formatting rules in order to improve legibility. These methods can exist all on one line, with no blank line between:

```

[source,cpp]
-----
public:
    wxString GetFoo() const { return m_foo; }
    void SetFoo( const wxString& aFoo ) { m_foo = aFoo; }
-----

```

== 5. License Statement

There is a file called `copyright.h`, which you can copy into the top of your new source files and edit the `\<author\>` field. KiCad depends on the copyright enforcement capabilities of copyright law, and this

means that source files must be copyrighted and not be released into the public domain. Each source file has one or more owners.

== 6. Debugging Output

Debugging output is a common method for validating code. However, it

should not always be active in debug builds. This makes it difficult for

other developers to see their debugging output and can have a significant

impact on the performance of debug builds. If you need to use debugging

output, use [link:https://docs.wxwidgets.org/3.2/group__group__funcmacro__log.html#ga9c530ae20eb423744f908](https://docs.wxwidgets.org/3.2/group__group__funcmacro__log.html#ga9c530ae20eb423744f908)

instead of ``printf`` or `{cpp}` output stream. If

you accidentally leave the debugging output in the source, it will expand

to nothing on release builds. All debugging output code should be removed

from the source tree before pushing changes to the main KiCad repo. Do not

comment out debugging output. This just adds more cruft to the code base.

If you need to leave debugging output on, for future testing, use tracing

output (see 6.1).

=== 6.1 Using Tracing for Debugging Output

There are occasions when you want to see debugging output to ensure

existing code performs as expected. In this case, use

[link:https://docs.wxwidgets.org/3.2/group__group__funcmacro__log.html#ga947e317db477914c12b13c4534867ec9](https://docs.wxwidgets.org/3.2/group__group__funcmacro__log.html#ga947e317db477914c12b13c4534867ec9)

which allows debugging output to be controlled by the ``WXTRACE`` environment

variable. When using `wxLogTrace`, the trace environment variable string should

be documented by either adding it to the ``trace_helper.{h/cpp}`` source files

or locally using the <https://www.doxygen.nl/index.html> [Doxygen]

comment ``\ingroup trace_env_vars``. To prevent ``WXTRACE`` name space conflicts,

all trace variable strings should be prefixed with `"KICAD_"`.

== 7. Header Files

Project *.h source files should:

- contain a license statement
- contain a nested include ``#ifndef``

- be fully self-contained and not depend on other headers that are not included within it.

The license statement was described above.

=== 7.1 Nested Include #ifndef

Each header file should include an `#ifndef` which is commonly used to prevent compiler errors in the case where the header file is seen multiple times in the code stream presented to the compiler. Just after the license statement, at the top of the file there should be lines similar to these (but with a file name specific token other than `RICHIO\_H\_`):

[source,cpp]

```
#ifndef RICHIO_H_
#define RICHIO_H_
```

And at the very bottom of the header file, use a line like this one:

[source,cpp]

```
#endif // RICHIO_H_
```

The `#ifndef` wrapper begins after the license statement, and ends at the very bottom of the file. It is important that it wrap any nested `#include` statements, so that the compiler can skip them if the

`#ifndef` evaluates to false, which will reduce compilation time.

=== 7.2 Headers Without Unsatisfied Dependencies

Any header file should include other headers that it depends on. (Note:

KiCad is not at this point now, but this section is a goal of the

project.)

It should be possible to run the compiler on any header file within the project, and with proper include paths being passed to the compiler, the

header file should compile without error.

****Example****

```
$ cd path_to_kicad_source/include  
$ g++ `wx-config --cxxflags` -I . xnode.h -o /tmp/junk
```

Such structuring of the header files removes the need within a client *.cpp file to include some project header file before some other project header file. (A client *.cpp file is one that intends to ****use, not implement,**** the public API exposed within the header file.)

Client code should not have to piece together things that a header file wishes to expose. The exposing header file should be viewed as a fully sufficient ****ticket to use**** the public API of that header file.

This is not saying anything about how much to expose, only that that which is exposed needs to be fully usable merely by including the header file that exposes it, with no additional includes.

For situations where there is a class header file and an implementation *.cpp file, it is desirable to hide as much of the private implementation as is practical and any header file that is not needed as part of the public API can and should be included only in the implementation *.cpp file. However, the number one concern of this section is that client (using) code can use the public API which is exposed in the header file, merely by including that one header file.

== 8. When in Doubt...

When editing existing source code files and there are multiple acceptable code formatting options or no formatting is defined, follow the existing formatting in the file.

== 9. I Wrote X Lines of Code Before I Read This Document

It's OK. We all make mistakes. Fortunately, KiCad provides a configuration file for the code beautifier uncrustify. Uncrustify won't fix your naming problems but it does a pretty decent job of formatting your source code. There are a few places where uncrustify makes some less than ideal indentation choices. It struggles with the string declaration macros `wxT("")` and `\_("")` and functions used as arguments to other functions. After you uncrustify your source code, please review the indentation for any glaring errors and manually fix them. See the uncrustify [website][uncrustify] for more information.

[uncrustify]: <http://uncrustify.sourceforge.net/>

== 10. Show Me an Example

Nothing drives the point home like an example. The source file `richio.h` below was taken directly from the KiCad source.

[source,cpp]

```

== 11. Resources

There are plenty of excellent resources on the Internet on {cpp} coding styles and coding dos and don'ts. Here are a few useful ones. In most cases, the coding styles do not follow the KiCad coding style but there is plenty of other good information here. Besides, most of them have some great humor that makes them enjoyable to read. Who knows, you might even learn something new.

title: Commit Message Format Policy

weight: 3

summary: The guidelines describing how git commit messages should be formatted.

:toc:

== Commit Message Format Policy

Commit messages must begin with a brief subject line. The subject line limit is 72 characters. If there is a body message, it must be separated from the subject line by a blank line and wrapped at 75 characters.

The body of a commit message should explain what the commit does and why. Do not explain **how** the changes work as the code itself should do that.

== Linking a Commit to an Issue

If your commit fixes an issue that has been reported in the <https://gitlab.com/kicad/code/kicad/issues>[issue tracker], add a blank line after the subject line or message body and add a line indicating the fixed issue number to your commit message. In such cases, GitLab will automatically close the issue and add a link to the commit in the issue.

For example, the following line will automatically close issue #1234567:

Fixes <https://gitlab.com/kicad/code/kicad/issues/1234567>

There is an `<<commit_fixes_alias, alias>>` to simplify this step. Read more about automatic issue closing in the

https://docs.gitlab.com/ee/user/project/issues/managing_issues.html#closing-issues-automatically[GitLab d

== Changelog Tags

To facilitate following the code changes, include a changelog tag to indicate modifications noticeable by the users. There are three types of changelog tags:

- `ADDED` to denote a new feature.
- `CHANGED` to indicate a modification of an existing feature.
- `REMOVED` to inform about removal of an existing feature.

There is no need to add changelog tags for commits that do not modify the way the users interact with the software, such as code refactoring or a bug fix for unexpected behavior. The purpose of the changelog tags is to generate release notes and notify the documentation maintainers about changes.

=== Making the Documentation Developers Aware of Changes

When a commit with changelog tag is pushed, the committer should create a new issue in the <https://gitlab.com/kicad/services/kicad-doc/issues>[documentation repository] to notify the documentation maintainers. Include a link to the commit containing the reported changes.

=== Extracting Changelogs

Thanks to the changelog tags, it is easy to extract the changelog using git commands:

```
```sh
git log -E --grep="ADD[ED]?:|REMOVE[D]?:|CHANGE[D]?:" --since="1 Jan 2017"
 git log -E --grep="ADD[ED]?:|REMOVE[D]?:|CHANGE[D]?:" <commit hash>
```
```

KiCad provides an `<<commit_changelog_alias, alias>>` to shorten the changelog extraction commands.

=== Example

Following is an example of a properly formatted commit message:

Eeschema: Adding line styling options

ADDED: Add support in Eeschema for changing the default line style,
width and color on a case-by-case basis.

CHANGED: "Wire" lines now optionally include data on the line style,
width and color if they differ from the default.

Fixes <https://gitlab.com/kicad/code/kicad/issues/594059>

Fixes <https://gitlab.com/kicad/code/kicad/issues/1405026>

== Git Aliases File

There is a file containing helpful git aliases located at
`tools/git/fixes\_alias`. To install it, run in the source repository:

```
```sh
```

```
git config --add include.path $(pwd)/tools/git/fixes_alias
```

```
```
```

```
[[commit_fixes_alias]]
```

=== 'fixes' Alias

Once the alias configuration file is installed, it may be used to amend the
most recent commit to include the bug report link:

```
git fixes 1234567
```

For example, the command below will append a line to the last commit message:

```
Fixes https://gitlab.com/kicad/code/kicad/issues/1234567
```

```
[[commit_changelog_alias]]
```

=== 'changelog' Alias

With the alias configuration file installed, changelogs can be extracted by running the following:

```
```sh
 git changelog --since="1 Jan 2017"
 git changelog <commit hash>
```
```

title: KiCad Developer Culture

weight: 6

summary: The guidelines describing how the lead developer team interacts with each other.

:toc:

== Purpose

This document lays out the desired ways of working for the KiCad lead development team.

It is meant to provide a basic introduction for new developers as well as a reference

for current lead developers in how to manage and resolve uncertainty and conflicts.

=== Base Guidelines

- We are a team of equals.
- We respect our userbase.
- We respect each others' contributions.
- The code we contribute belongs to everyone.
- In a disagreement, everyone gives a little.
- We prioritize our families, our health and our offline lives ahead of KiCad.

== Discussion

=== We are a team of equals

This means that your opinions will be given equal weight with every other person on the lead developer team.

In the event a decision is deadlocked after multiple developers have weighed in, the resolution will be made by the lead developer team. We also recognize that we each bring different experiences to the team. We will try to give weight to the

=== We respect our userbase

We all come to this project, developers and users, with differing expectations, experiences and english fluency. When we interact with each other, it is inevitable that these differences will lead to conflict over politeness, appropriate expression of opinion, and other _impedance mismatches_ we might have in our communications.

As lead developers, our behavior in public project spaces reflects on the project as a whole. We will hold ourselves to a higher standard in our behavior than the standard to which we hold the end users.

We will not respond to any issue report, merge request or forum post when we feel annoyed or irritated by the content of the post. We provide a Zulip channel where lead developers can tag others to take on the discussion.

1. Post a link to the page in question
2. (optional) Express any frustrations we have
3. Say why this content is wrong

(1) and (3) are required. (2) is optional but available if it helps to diffuse the emotion around the content.

Failing to follow this guideline will inevitably lead to drama. And drama sucks time from both you, the contributor, and the lead developer team as we end up dealing with the response and not the actual content.

=== We respect each others' contributions

While we all make mistakes, we will not revert the contributions of other developers without their explicit consent, even when we think that they might not have implemented something in accordance with our views of the policies. We each are responsible for the quality of our own contributions.

If there is a disagreement over a commit, it must be worked out over e-mail/Zulip/video call/etc with the person committing the code.

We do not fight in the code base.

In the event that a problematic commit has been made to the codebase and the person responsible is not available to discuss it, then the commit can be reverted after publicly (either on GitLab or Zulip)

discussing and agreeing on this with the rest of the lead development team.

When we disagree with a contribution made by another developer, we will address it directly with them politely. Examples of polite feedback might include:

> This code doesn't work for me when I...

Or

> I think that this code will cause problems because...

Examples of rude feedback that we will avoid include:

> This code stinks/sucks/is really bad/etc

Or

> Whoever screwed up this part of the codebase...

Naturally, we are all welcome to provide ourselves with as much impolite feedback on code we have written as we can handle. :)

=== The code we contribute belongs to everyone

We are a free/libre open source community. Everything that we contribute to the KiCad project belongs to

When we commit code to the KiCad codebase, we are standing on the shoulders of everyone who has done so before

=== In a disagreement, everyone gives a little

We will frequently come to a point in discussion of either the specification document or code itself where

We decide which parts of a feature are more important to us and ask for those parts to exist, giving up on the rest. We offer our opinions in ways that make it known how important the opinion is and why. For example:
> It is very important that I am able to modify the start point of lines and arcs in the same way because
Or

> I have a preference for the print dialog being non-modal so that I can see the preview update in real t

It is important to assess our own priorities when entering a conversation with other developers. Not ever

NOTE: Each developer on the team is highly skilled and if more than one is disagreeing with you, it is al

We will give extra consideration to the concerns raised by the developers who actively use a feature and

If the developers involved in the discussion cannot agree, after each has moderated their position to acc

=== We prioritize our families, our health and our offline lives ahead of KiCad
KiCad is a wonderful place to contribute to the community. We strive to be open and engaged with each oth

We will design our systems and procedures in such a way that facilitates anyone needing to take an unexpec

title: Icon Design Guidelines

weight: 5

summary: The style guidelines that should be used for visual asset (icon, etc.) changes or additions.

:toc:

== 0. Community Contributions

In general, KiCad does not accept contributions of graphic assets (icons, etc.) from the community directly. The lead development team may make small tweaks to icons themselves, but aims to employ professional graphic designers for larger changes and development of new assets.

Community contributors looking to add new features to KiCad that require new art assets (for example, adding a tool that requires a toolbutton icon) may create placeholder art to be used until a final asset can be created. This placeholder art may be modified or replaced at the discretion of the KiCad lead development team in coordination with an external designer.

This policy is aimed at achieving a consistent and unified look and feel for KiCad and also removing debate over art assets from the review process for community contributions. We still welcome feedback and suggestions related to art assets from the community, and will consider this type of input when discussing changes or additions to KiCad's art assets.

The following guidelines are presented for reference and represent the current consensus of the lead development team. New placeholder art assets should attempt to follow these guidelines.

== 1. Look and Feel

The KiCad icon design guidelines are intended to create a consistent visual style for icons across KiCad. The visual style is intended to provide a

balance between each icon being unique enough that it is easy to locate, but not so unique that there is no consistent theme among all the icons and it looks like each was designed by a different person. The general principles of that visual style are:

1. **Flat design**: icons should not use gradients, shadows, or other “3D” effects.
2. **Standard color palette**: icons should make use of a restricted color palette, listed in this document. Additions to or changes to this color palette must be discussed with the lead development team, as it could require changing many icons for the sake of consistency.
3. **Use color sparingly where shape is sufficient**: color should be used to clarify differences between icons that have similar shapes. Icons that can convey their meaning through shape alone (and not be confused with other icons) should be monochrome, just using the primary color (Dark Grey in the light theme)
4. **Pixel alignment**: icons are designed as vectors but used as bitmaps. Vector graphics must be designed for proper pixel alignment at the target icon size(s) to prevent blurriness.
5. **Consistency**: icons describing the same concept should be consistent in their use of color and shape to describe that concept. For example, all icons that include control points should make those control points Blue in color.
6. **Minimalism**: not much detail is preserved in a 24x24 icon. Be sparing with the use of fine features, especially when those fine features are all that tell one icon apart from another.
7. **Window theme aware**: even setting aside those operating systems with “dark modes”, the window background color of KiCad can vary quite a lot across operating systems. Be careful when using colors in ways that may disappear against the window background. In particular, Accent Gray, White, and Schematic Tan will be very hard to see against the window background. Only use these colors on top of a background of a different color to create sufficient contrast.

== 2. Technical Requirements and Licensing

Icons must be developed as SVG files. Building and testing icon changes requires you to have Inkscape and pngcrush installed, as detailed in the CMakeLists.txt file in the bitmaps_png source

directory. If your version of pngcrush does not match that used by the lead development team (1.8.13), you will see a large number of differences in your source tree.

Icons must be licensed as Creative Commons Attribution-ShareAlike (CC-BY-SA) using an embedded license in the SVG file. This can be added in Inkscape using the Document Properties dialog.

== 3. Authoring Software

SVG files must be edited in Inkscape 1.0 or higher. While other packages such as Adobe Illustrator are able to export SVG files, they export only the look of the icon. They frequently skip other details such as layers, hidden lines, clipping, grids and licenses that make the file easier to edit in the future. We recommend making use of the Icon Preview feature in Inkscape to make sure your vector graphics are properly aligned to the pixel grid and will be clear at the target size.

== 4. Grids

The icon file must have a grid set in the Inkscape SVG file. The grid units must be `px` with an origin at `0,0` and spacing of `0.5 px`. The Minor grid line color should be `#ceceff20` and the major grid line color should be `#3f3fff40`. There should be a major grid line every 2 lines.

This allows both even and odd sized line widths to be pixel aligned on the grid. This is set in the Document Properties window as follows:

```
image::grids.png[Grid settings]
```

== 5. Icon Sizes

```
[%header,cols="1,4a"]
```

```
|===
```

```
|Size    |Uses
```

```
|16x16   |* Some UI buttons
```

```
        * Appearance panel visibility toggles
```

```
        * File icons
```

```
|24x24   |* All toolbar buttons
```

* All menu icons (at the moment)

|48x48 |* Main program icons in KiCad manager

|128x128|* Main program icons (ico files)

|===

== 6. Colors

With few exceptions, only use the colors in these tables for SVG objects (additional colors will exist in the generated bitmaps due to blending).

=== 6.1. Light Theme

[%header,cols="1,1a,4a"]

|===

| Color Name | Color Value | Uses/Notes |
|------------|-------------|------------|
|------------|-------------|------------|

| | | |
|--------------|-----------|---|
| Primary Gray | `#545454` | This is the default color to use for all strokes. |
|--------------|-----------|---|

Note that in dense fills (e.g. Save, Print, Paste icons) it will appear

darker than the identical grey in other icons. For these cases we use `#606060``.

| | | |
|-------------|-----------|--|
| Medium Grey | `#848484` | Used for inactive objects to reduce contrast compared to Dark Grey |
|-------------|-----------|--|

| | | |
|-------------|-----------|---|
| Accent Grey | `#B9B9B9` | Used for the hole inside a via and the fill inside graphic shapes |
|-------------|-----------|---|

| | | |
|--------------|-----------|--|
| Primary Blue | `#1A81C4` | Used to accentuate certain details and for "back copper" in PcbNew |
|--------------|-----------|--|

| | | |
|-------------|-----------|---|
| Accent Blue | `#39B4EA` | Used to show zone fill in some places, and as an accent color |
|-------------|-----------|---|

| | | |
|-------------|-----------|--|
| Primary Red | `#BF2641` | Used for accents, badges, and "front copper" in PcbNew |
|-------------|-----------|--|

| | | |
|------|-----------|--|
| Gold | `#F29100` | Used for via copper, and (rarely) as an accent |
|------|-----------|--|

| | | |
|-----------|-----------|--|
| PCB Green | `#489648` | Used in the PcbNew program icon for traces |
|-----------|-----------|--|

| | | |
|----------------|-----------|--|
| PCB Dark Green | `#006400` | Used in the PcbNew program icon for soldermask |
|----------------|-----------|--|

| | | |
|---------------|-----------|---|
| Schematic Tan | `#D0C5AC` | Used in the Eeschema icon and to represent schematic sheets |
|---------------|-----------|---|

| | | |
|------------|-----------|--|
| Pure White | `#FFFFFF` | Used for contrast against dark colors and separation between objects |
|------------|-----------|--|

| | | |
|-----------|-----------|--|
| Area Fill | `#F3F3F3` | Used for large fills of white (e.g. New) instead of Pure White |
|-----------|-----------|--|

|===

=== 6.2. Dark Theme

[%header,cols="1,1a,4a"]

|===

| Color Name | Color Value | Uses/Notes |
|------------|-------------|------------|
|------------|-------------|------------|

| | | |
|--------------|-----------|---|
| Primary Gray | `#DED3DD` | This is the default color to use for all strokes. |
|--------------|-----------|---|

Note that in dense fills (e.g. Save, Print, Paste icons) it will appear darker than the identical grey in other icons. For these cases we use #`606060`.

| | | |
|----------------|-----------|--|
| Medium Grey | `#848484` | Used for inactive objects to reduce contrast compared to Dark Grey |
| Accent Grey | `#E0E0E0` | Used for the hole inside a via and the fill inside graphic shapes |
| Primary Blue | `#42B8EB` | Used to accentuate certain details and for "back copper" in PcbNew |
| Accent Blue | `#1A81C4` | Used to show zone fill in some places, and as an accent color |
| Primary Red | `#F2647E` | Used for accents, badges, and "front copper" in PcbNew |
| Gold | `#F29100` | Used for via copper, and (rarely) as an accent |
| PCB Green | `#489648` | Used in the PcbNew program icon for traces |
| PCB Dark Green | `#006400` | Used in the PcbNew program icon for soldermask |
| Schematic Tan | `#D0C5AC` | Used in the Eeschema icon and to represent schematic sheets |
| Pure White | `#FFFFFF` | Used for contrast against dark colors and separation between objects |
| Area Fill | `#545454` | Used for large fills of white (e.g. New) instead of Pure White |

|===

== 7. Lines and Fills

Line weights in SVG files should usually be `1.5px` or heavier, to ensure that in the final bitmap, there are pixels with the true color no matter the placement of the line with regards to the pixel grid. Horizontal and vertical lines should usually be `2px` where they convey the main meaning of the image. 1px lines are OK when part of a larger whole.

Line weights representing certain concepts should be kept consistent throughout the icon set where practical. For example, graphical shape drawing tools use `2px` lines always.

In general the icon set uses "flat filled" shapes where applicable. Maintain this visual style when creating new icons. Note that not all shapes must be filled -- stroked shapes with no fill can be used (along with the window background color) to create a contrasting filled area. Strokes should be constant-width in general to avoid looking like hand-drawn brush strokes ("cartoon style").

Fills should use solid colors in almost all instances. Gradients should be used sparingly, and

generally not to create "3D" effects or the appearance of lighting/shadows.

== 8. Fonts

We use two fonts in the icons: Noto Sans and Tiresias LPFont Bold. Noto Sans is used by default for all text. Tiresias is used for the "Ki" logo. Noto Sans may be used in different weights and spacing, e.g. Noto Sans Bold, Semi-condensed, if needed for spacing or line weight.

Tiresias LPFont Bold may only be used as Tiresias LPFont Bold without substitution.

== 9. Badges

Badges are symbols that overlay other icons to add meaning. These symbols come from a shared library (badges.svg in the sources directory). Always use the appropriate badge with consistent placement (you can copy/paste from the badges SVG) rather than creating new artwork that conveys the same meaning as a badge.

Badges should generally be used without modification, but in some cases it is helpful to add a 1px-1.5px stroke border (in Pure White for the light theme) to the outside of the badge to ensure visual separation between the badge and the icon content underneath.

Resumo: --- title: Stable Release Policy weight: 4 summary: The stable release policy provides guidelines for stable releases provided by the KiCad project. --- :toc: == 1 Introduction The purpose of this document is to provide the guidelines for creating releases for the KiCad project...

title: Stable Release Policy

weight: 4

summary: The stable release policy provides guidelines for stable releases
provided by the KiCad project.

:toc:

== 1 Introduction

The purpose of this document is to provide the guidelines for creating releases
for the KiCad project.

NOTE: This document is applicable to all stable releases after version 6.0.0.

WARNING: Do not modify this document without the consent of the project leader.

All changes to this document require approval.

=== 1.1 Versioning Scheme

KiCad uses a typical [major].[minor].[bug fix] versioning scheme. Each new
version is a simple incremental integer of the previous version. New major
releases will reset the minor and bug fix version back to 0.

=== 1.2 Restrictions

No board, schematic, footprint library, symbol library, or project file format
changes are allowed during a major release cycle except to fix known bugs.

Changes to configuration files are acceptable.

Minor and bug fix releases are only valid for the current stable major release.

Once a new stable major version is released, the previous stable version is
considered a no longer supported (dead) branch.

== 2 Major Release Policy

Major releases will occur annually by January 31st of a given calendar year.

This corresponds with the annual <https://fosdem.org/>[FOSDEM] conference.

The following table outlines the release schedule dates.

.Major Release Schedule

[%header,cols="1,5"]

|===

|Date

|Milestone

|February 1st

|New feature merge window opens.

|September 30th

|New feature merge window closes.

Bug fixing only period begins.

|December 1st

|String freeze begins.

|December 15th

|Release candidate 1 tagged.

|January 14th

|Library, documentation, and, translation repository freeze.
Bug fix freeze.

|January 15th

|Source code repository tagged with next major version and branched.

Begin package build and upload to website.

|January 31st

|New version release announcement.

|===

WARNING: Features not ready by the merge window close will have to wait until the next merge window. *No exceptions.*

NOTE: Only the source code repository branch is mandatory. All other repositories are branched if the development team determines it is necessary.

== 3 Minor Release Policy

Features from the current development branch of KiCad can be back ported to the current stable branch provided the following criteria is met:

- The the last feature commit was pushed to the development branch at least 60 days prior to merging into the current stable branch.
- The the last known issue filed against the feature occurred at least 30 days prior to merging into the current stable branch.
- The cherry pick to current stable can be performed without pulling any other dependent code that does meets the file format change criteria above.

A new minor release will include all of the bug fixes included in the current bug fix release so the bug fix version will be reset to 0 for new minor version releases.

NOTE: Back ports from the development branch can only be applied to the current stable branch. Back porting to older stable versions is not allowed.

== 4 Bug Fix Release Policy

Bug fix releases are at the discretion of the lead development team.

Bug fix releases will be announced 14 days in advance of the release by the project manager to allow time for all required release actions to be completed. A release candidate ``-rc1`` tag will be created a minimum of three days before

the final release. The release candidate will be announced by the project leader on the [https://www.kicad.org/blog/\[KiCad blog\]](https://www.kicad.org/blog/[KiCad blog]) along with the usual KiCad social media sites.

During the release candidate period, only regression fixes since the last bug fix release are allowed. All other bug fixes must wait until after the bug fix release period and release announcement are completed.

If a regression is fixed in the release candidate before the three day minimum testing period ends, a new incremental release candidate will be created and the three day minimum testing period begins from the date of the new release candidate. This process repeats until no new regressions are found in a release candidate. Multiple regressions may be fixed between release candidates.

The final bug fix release will be tagged if no new regressions occur within three days of the last release candidate.

NOTE: Bug fixes cannot contain translatable string changes except for spelling and grammar errors. New strings are allowed assuming they do not clash with any existing strings.

NOTE: Bug fixes can only applied to the current stable release.

Resumo: --- title: User Interface Policy weight: 10 summary: Rules on how the user interface elements should be implemented. --- :toc: == Introduction This document defines the guidelines for user interface development in KiCad. Developers are expected to following these guidelines as closely...

title: User Interface Policy

weight: 10

summary: Rules on how the user interface elements should be implemented.

:toc:

== Introduction

This document defines the guidelines for user interface development in KiCad. Developers are expected to following these guidelines as closely as possible when contributing user interface code to the KiCad project.

== Follow platform-specific guidelines

Except for the cases listed below, KiCad follows the platform-specific user interface guidelines for each supported platform on that platform. This means there may be differences in UI behavior/look-and-feel between the platforms where their guidelines differ.

The user interface guidelines for each supported platform are:

* GNOME (GTK): <https://developer.gnome.org/hig/stable/>

* macOS: <https://developer.apple.com/design/human-interface-guidelines/macOS/overview/themes/>

* Windows: <https://docs.microsoft.com/en-us/windows/win32/uxguide/guidelines>

IMPORTANT: UI behavior that is inconsistent with the platform default or that would override platform defaults/theme settings must be avoided.
== Text and strings

=== Text Capitalization

For all visible text used within KiCad, follow recommendations in the capitalization section in the <https://developer.gnome.org/hig/guidelines/writing-style.html> [writing style section of the GNOME User Interface Guidelines]. This applies to all Menus, Titles, Labels, Tooltips, Buttons, etc.

The capitalization for the application names is KiCad, Eeschema, CvPcb, GerbView, and Pcbnew. All strings that have application names that are visible to the user should be capitalized this way. It's also a good idea use this capitalization in source code comments as well to prevent confusion of new contributors.

=== Capitalization Styles

There are two styles of capitalization used in the user interface elements: header capitalization and sentence capitalization. This section defines the capitalization style and when each type of capitalization should be used.

==== Header Capitalization

When using header capitalization all words are capitalized with the following exceptions:

- * Articles: a, an, the.
- * Conjunctions: and, but, for, not, so, yet ...
- * Prepositions of three or fewer letters: at, for, by, in, to ...

==== Sentence Capitalization

When capitalizing sentences, capitalize the first letter of the first word, and any other words normally capitalized in sentences such as proper nouns.

=== Capitalization Table

The following table indicates the capitalization style to use for each type

of user interface element.

```
[cols=2*,options="header"]  
  
|===  
|Element | Style  
|Check box labels | Sentence  
|Command button labels | Header  
|Column heading labels | Header  
|Desktop background object labels | Header  
|Dialog messages | Sentence  
|Drop-down combination box labels | Sentence  
|Drop-down list box labels | Sentence  
|Field labels | Sentence  
|Group box and window frame labels | Header  
|Hypertext links | Sentence  
|Items in drop-down and list controls | Sentence  
|List box labels | Sentence  
|Menu items | Header  
|Menu items in applications | Header  
|Menu titles in applications | Header  
|Property names displayed in the Properties Panel | Header  
|Radio button labels | Sentence  
|Slider labels | Sentence  
|Spin box labels | Sentence  
|Tabbed section titles | Header  
|Text box labels | Sentence  
|Text on web pages | Sentence  
|Titlebar labels | Header  
|Toolbar button labels | Header  
|Tooltips | Sentence  
|Webpage titles and navigational elements | Header  
|===
```

=== Trailing Periods

* Phrases, such as checkbox labels, button labels, dialog box titles, etc., should

not have trailing periods.

- * Fully-formed sentences, such as error messages, should have trailing periods.

There are some edge-cases:

- * Tooltips are generally phrases and therefore have no trailing periods. However, when they are multiple sentences, each sentence in the tooltip should have a period, including the last one.

- * ERC and DRC messages are often sentences, but should NOT have trailing periods.

This makes them easier to scan.

=== Ellipses in menu entries

Menu entries which open a dialog to collect more information before performing an action should have an ellipsis at the end. Menu entries whose action is to open a window or dialog should not. e.g.:

- * Save As...

- * Change Symbols...

- * Clearance Resolution

- * Calculator Tools

=== Quoting

Often text strings will be quoted for display which may be used in controls that render HTML. Using angle brackets will cause grief for HTML rendering controls so text should be quoted with single quotes '. e.g.:

- * 'filename.kicad_pcb'

- * 'longpath/subdir'

- * 'FOOTPRINTNAME'

- * 'anything else'

=== Abbreviations

All user interface strings should be spelled out for translation purposes.

The only exceptions are units such as mm, in, etc. or universally accepted abbreviations across languages such as PCB.

== Dialogs

This section defines how dialog boxes should be designed. The KiCad project uses the [https://developer.gnome.org/hig/stable/\[GNOME User Interface Guidelines\]](https://developer.gnome.org/hig/stable/[GNOME User Interface Guidelines]) for laying out dialogs. When designing dialogs, follow the <https://developer.gnome.org/hig/stable/visual-layout.html.en> User Interface Guidelines]. KiCad's dialogs may either be designed with <https://github.com/wxFormBuilder/wxFormBuilder> or created by hand. Existing dialogs must be maintained in the same way as they have been implemented. Please use the latest <https://github.com/wxFormBuilder/wxFormBuilder/releases> to avoid version mismatch between developers.

=== Escape Key Termination

Please note that the escape key termination only works properly if there is a dialog button defined with an ID of `wxID_CANCEL` or setting the escape button ID using [link:http://docs.wxwidgets.org/3.0/classwx_dialog.html#a585869988e308f549128a6a065f387c6](http://docs.wxwidgets.org/3.0/classwx_dialog.html#a585869988e308f549128a6a065f387c6) is called during dialog initialization. The former is the preferred method for handling escape key dialog termination. There is a checkbox in `wxFormBuilder` for setting the "default" control, and this is the one fired when the "enter" key is pressed.

=== Dialog Layout with Sizers

Use `wxWidgets` "sizers" in all dialogs, no matter how simple they are. Using absolute sizing in dialogs is forbidden in KiCad. See the [link:http://docs.wxwidgets.org/3.0/overview_sizer.html](http://docs.wxwidgets.org/3.0/overview_sizer.html) for more information on using sizers. Configure the sizers so that as the dialog window is expanded, the most sensible use of the increased dialog window occurs automatically by the sizers. For example, in the DRC dialog of `Pcbnew`, sizers should be used to expand the text control to use the full available free window area, so that the user's view of the items in the text

control is maximized as he/she expands the dialog window, making it easier to read more DRC error messages. In other dialogs without one component more important than the others, the sizers might be configured to position the controls to sensible positions near the perimeter of the increasingly larger dialog box, not necessarily leaving them all bundled tightly together. The dialog box should look nice at any size large enough to show all the user interface elements.

Avoid defining initial dialog sizes if possible. Let the sizers do their job. After the dialog is fit to the sizers, set the minimum size to the current size to prevent the dialog controls from being obscured when resizing the dialog. If the labels or text of the dialog controls are, set or changed at run time. Rerun `wxWindow::Fit()` to allow the dialog to re-size and adjust for the new control widths. This can all be done after the dialog is created but before it is shown or use class methods to re-size the dialog as required. Reset the minimum size to the updated dialog size.

Dialog windows should not exceed 1024 x 768 when displayed in a 13 point font. Note that the font used by end users is not something that you control from within the dialog, but for testing purposes please do not exceed this dialog size should the user have selected a font size of 13 points. If your dialog exceeds this limit, please redesign the dialog using tabs or some other paging method to reduce the size of the dialog.

=== Dialog Base Class

The KiCad project has a base class which most if not all dialogs should be derived from. When using `wxFormBuilder`, please add the following settings to the "Dialog" tab:

```
* subclass.name    <- DIALOG_SHIM
* subclass.header  <- dialog_shim.h
```

This will provide for an override of the `Show( bool ) wxWindow()` function

and provide retentive size and position for the session. For more information, see the

[link:https://gitlab.com/kicad/code/kicad/-/blob/master/common/dialog_shim.cpp](https://gitlab.com/kicad/code/kicad/-/blob/master/common/dialog_shim.cpp)[DIALOG_SHIM class source code]

Use tooltips to explain the functionality of each non-obvious control.

This is important because the help files and the wiki often lag behind the source code.

=== Transferring Data To and From Controls

Dialog data must be transferred to the dialog controls on dialog initialization and transferred from controls when the dialog is dismissed by the default affirmative action (typically clicking the wxID_OK button) or the clicking the wxID_APPLY button. The wxWidgets dialog framework has support for this by using validators. Please read the

https://docs.wxwidgets.org/3.0/overview_validator.html[wxValidator Overview] in the <http://docs.wxwidgets.org/3.0/>[wxWidgets documentation]. In the past, data transfer was handled in various default button handlers virtually all of which were broken. Do not implement default button handlers in your dialog code. Use validators to transfer data to and from controls and allow the default dialog button handlers work the way they were designed.

=== Internationalization

To generate a list of strings occurring in a dialog, one needs to enable 'internationalize' checkbox in the project properties when using wxFormbuilder. Otherwise, it will not be possible to translate the dialog.

== Translating the KiCad GUI

KiCad translations are managed by Weblate.

The link:[https://hosted.weblate.org/projects/kicad/master-source/\[Weblate project\]](https://hosted.weblate.org/projects/kicad/master-source/[Weblate project]) is periodically
synchronized with the KiCad source code repository on GitLab to apply newly-created translations
and to import new or changed source (English) text into Weblate so that it can be translated.

Please see the link:<https://docs.weblate.org/en/latest/user/translating.html>[Weblate documentation]
for details on how to use the Weblate interface to translate KiCad.

At this time, the French translation of KiCad is managed outside of Weblate by Jean-Pierre Charras,
so French is not available as one of the translated languages to edit in Weblate.

Please use the developers email list for any questions or issues relating to translating KiCad.

Resumo: # Changelog ## 6.0.0 (2024-04-27) ### Enhancements - **feature** **breaking** theme: unify description [#845](https://github.com/McShelby/hugo-theme-relearn/issues/845) - **feature** schema: add schema support in meta data [#844](https://github.com/McShelby/hugo-theme-relearn/issues/844)

Changelog

6.0.0 (2024-04-27)

Enhancements

- **feature** **breaking** theme: unify description [#845](https://github.com/McShelby/hugo-theme-relearn/issues/845)
- **feature** schema: add schema support in meta data [#844](https://github.com/McShelby/hugo-theme-relearn/issues/844)
- **feature** include: use Hugo's resources [#835](https://github.com/McShelby/hugo-theme-relearn/issues/835)
- **feature** math: allow to work with Hugo's passthrough configuration [#832](https://github.com/McShelby/hugo-theme-relearn/issues/832)
- **feature** i18n: add Romanian translation [#828](https://github.com/McShelby/hugo-theme-relearn/issues/828)
- **feature** **breaking** menu: remove menuTitle frontmatter [#714](https://github.com/McShelby/hugo-theme-relearn/issues/714)
- **feature** **breaking** theme: end support for Internet Explorer 11 [#584](https://github.com/McShelby/hugo-theme-relearn/issues/584)

Fixes

- **bug** frontmatter: move frontmatter config for exampleSite out of root [#843](https://github.com/McShelby/hugo-theme-relearn/issues/843)
- **bug** images: color outline using primary color [#838](https://github.com/McShelby/hugo-theme-relearn/issues/838)
- **bug** **breaking** variant: avoid Hugo permission errors on build [#831](https://github.com/McShelby/hugo-theme-relearn/issues/831)
- **bug** theme: unwanted paragraph break with AsciiDoc [#829](https://github.com/McShelby/hugo-theme-relearn/issues/829)

Maintenance

- **task** **breaking** swagger: remove shortcode [#847](https://github.com/McShelby/hugo-theme-relearn/issues/847)
- **task** **breaking** search: remove JSON outputformat for search index [#846](https://github.com/McShelby/hugo-theme-relearn/issues/846)
- **task** theme: sync to Hugo's implementation [#841](https://github.com/McShelby/hugo-theme-relearn/issues/841)
- **task** **change** fontawesome: update to 6.5.2 [#834](https://github.com/McShelby/hugo-theme-relearn/issues/834)

5.27.0 (2024-04-07)

Enhancements

- **feature** theme: simplify title generation [#825](https://github.com/McShelby/hugo-theme-relearn/issues/825)

- **feature** theme: adjust to Hugo's build-in code [#824](https://github.com/McShelby/hugo-theme-relearn)
- **feature****change** link: warn if fragment is not found [#823](https://github.com/McShelby/hugo-theme-relearn)
- **feature** theme: add styling for selected HTML elements [#822](https://github.com/McShelby/hugo-theme-relearn)
- **feature** a11y: improve search box [#821](https://github.com/McShelby/hugo-theme-relearn/issues/821)
- **feature****change** dependencies: make loader more versatile [#820](https://github.com/McShelby/hugo-theme-relearn)
- **feature** nav: scroll to prev/next heading using keyboard shortcut [#819](https://github.com/McShelby/hugo-theme-relearn)
- **feature** breadcrumb: use .LinkTitle instead of .Title if available [#816](https://github.com/McShelby/hugo-theme-relearn)

Fixes

- **bug** scrollbar: scroll bar in side menu gets stuck in dragged state on mobile [#808](https://github.com/McShelby/hugo-theme-relearn)

5.26.2 (2024-03-18)

Enhancements

- **feature** icons: use fixed width to ease layout [#812](https://github.com/McShelby/hugo-theme-relearn)

Fixes

- **bug** search: broken since version 5.26.1 [#813](https://github.com/McShelby/hugo-theme-relearn/issues/813)
 - **bug** search: fix result links for pages in root [#810](https://github.com/McShelby/hugo-theme-relearn/issues/810)
-

5.26.1 (2024-03-17)

Fixes

- **bug** mermaid: show reset button after pan [#807](https://github.com/McShelby/hugo-theme-relearn/issues/807)
- **bug** openapi: make it run for `file://` protocol [#806](https://github.com/McShelby/hugo-theme-relearn/issues/806)
- **bug** theme: fix relative path detection if `relativeURLs=false` [#804](https://github.com/McShelby/hugo-theme-relearn/issues/804)

5.26.0 (2024-03-16)

Enhancements

- **[**feature**]** image: add lazy loading image effect option [#803](https://github.com/McShelby/hugo-theme-relearn/commit/00)
- **[**feature**]** render-hook: support Markdown attributes [#795](https://github.com/McShelby/hugo-theme-relearn/commit/00)
- **[**feature**]** theme: support full page width [#752](https://github.com/McShelby/hugo-theme-relearn/commit/00)

Fixes

- **[**bug**]** clipboard: fix broken style if block code is in table [#790](https://github.com/McShelby/hugo-theme-relearn/commit/00)
- **[**bug**]** nav: browser back navigation does not jump to the correct position [#509](https://github.com/McShelby/hugo-theme-relearn/commit/00)

Maintenance

- **[**task**]** build: update all available actions to nodejs 20 [#802](https://github.com/McShelby/hugo-theme-relearn/commit/00)
- **[**task**]** openapi: update swagger-ui to 5.11.10 [#798](https://github.com/McShelby/hugo-theme-relearn/commit/00)
- **[**task**]** mermaid: update to 10.9.0 [#797](https://github.com/McShelby/hugo-theme-relearn/commit/00)

5.25.0 (2024-02-29)

Enhancements

- **[**feature**][**change**]** theme: print out GitInfo in page footer if configured [#786](https://github.com/McShelby/hugo-theme-relearn/commit/00)
- **[**feature**][**change**]** resources: new shortcode to deprecate attachments shortcode [#22](https://github.com/McShelby/hugo-theme-relearn/commit/00)

Fixes

- **[**bug**]** swagger: fix compat warning [#787](https://github.com/McShelby/hugo-theme-relearn/commit/00)

5.24.3 (2024-02-28)

Fixes

- **[**bug**]** theme: avoid crash on 404 if author settings want to warn [#785](https://github.com/McShelby/hugo-theme-relearn/commit/00)

5.24.2 (2024-02-24)

Enhancements

- **feature** image: adjust to Hugo 0.123 [#777](https://github.com/McShelby/hugo-theme-relearn/issues/777)

Fixes

- **bug** link: resolve fragments [#775](https://github.com/McShelby/hugo-theme-relearn/issues/775)

5.24.1 (2024-02-18)

Enhancements

- **feature** link: make resolution reporting configurable [#774](https://github.com/McShelby/hugo-theme-relearn/issues/774)

5.24.0 (2024-02-17)

Enhancements

- **feature** theme: compatibility with Hugo 0.123 [#771](https://github.com/McShelby/hugo-theme-relearn/issues/771)

- **feature** topbar: support editURL in frontmatter [#764](https://github.com/McShelby/hugo-theme-relearn/issues/764)

- **feature** menu: use --MENU-WIDTH-S to adjust mobile flyout [#761](https://github.com/McShelby/hugo-theme-relearn/issues/761)

- **feature** figure: support built-in shortcode [#746](https://github.com/McShelby/hugo-theme-relearn/issues/746)

- **feature** theme: make heading a template [#744](https://github.com/McShelby/hugo-theme-relearn/issues/744)

- **feature** taxonomy: make arrow nav browse through terms [#742](https://github.com/McShelby/hugo-theme-relearn/issues/742)

- **feature** theme: switch from config.toml to hugo.toml [#741](https://github.com/McShelby/hugo-theme-relearn/issues/741)

- **feature** button: make non-interactive if used as mock [#740](https://github.com/McShelby/hugo-theme-relearn/issues/740)

- **feature****change** topbar: allow text for button [#739](https://github.com/McShelby/hugo-theme-relearn/issues/739)

- **feature** theme: run hugo demo site without warning [#736](https://github.com/McShelby/hugo-theme-relearn/issues/736)

- **feature** menu: make swipe handler passive [#735](https://github.com/McShelby/hugo-theme-relearn/iss
- **feature** i18n: support standard Hugo options [#733](https://github.com/McShelby/hugo-theme-relearn
- **feature** a11y: show tab focus on images [#730](https://github.com/McShelby/hugo-theme-relearn/issu
- **feature** a11y: improve discovering links on keyboard navigation [#726](https://github.com/McShelby
- **feature****change** variant: increase contrast for light themes [#722](https://github.com/McShelby
- **feature** theme: break build if minimum Hugo version is not matched [#719](https://github.com/McShe
- **feature** taxonomy: humanize term on missing term title [#713](https://github.com/McShelby/hugo-ther

Fixes

- **bug** taxonomy: display translated title [#772](https://github.com/McShelby/hugo-theme-relearn/issu
- **bug** highlight: fix codefence syntax in Hugo >= 0.121.0 [#749](https://github.com/McShelby/hugo-th
- **bug** link: fix links to pages containing dots in their name [#748](https://github.com/McShelby/hug
- **bug** image: get resource images if link is prefixed with `./` [#747](https://github.com/McShelby/h
- **bug** theme: switch dependency colors on OS color scheme change [#745](https://github.com/McShelby/L
- **bug** clipboard: fix $O(n^2)$ buttons [#738](https://github.com/McShelby/hugo-theme-relearn/issues/738
- **bug** button: fix whitespacing in FF [#737](https://github.com/McShelby/hugo-theme-relearn/issues/73
- **bug** i18n: fix warning messages for zh-CN [#732](https://github.com/McShelby/hugo-theme-relearn/iss
- **bug** mermaid: fix zoom button [#725](https://github.com/McShelby/hugo-theme-relearn/issues/725)
- **bug** theme: fix JS errors on `hugo --minify` [#724](https://github.com/McShelby/hugo-theme-relearn
- **bug** include: fix whitespacing in codefences [#723](https://github.com/McShelby/hugo-theme-relearn

5.23.2 (2023-11-03)

Enhancements

- **feature** taxonomy: improve taxonomy page [#712](https://github.com/McShelby/hugo-theme-relearn/iss
- **feature** taxonomy: warn on missing term title [#709](https://github.com/McShelby/hugo-theme-relearn

Fixes

- **bug** taxonomy: fix sorting of terms on content pages [#710](https://github.com/McShelby/hugo-theme

5.23.1 (2023-10-30)

Enhancements

- **taxonomy**: improve term page [#705](https://github.com/McShelby/hugo-theme-relearn/issues/705)

Fixes

- **variant**: fix typo in chroma-learn.css [#708](https://github.com/McShelby/hugo-theme-relearn/issues/708)
- **links**: ignore local markdown links linking to files with extension [#707](https://github.com/McShelby/hugo-theme-relearn/issues/707)

5.23.0 (2023-10-29)

Enhancements

- **taxonomy**: allow for content on term pages [#701](https://github.com/McShelby/hugo-theme-relearn/issues/701)
- **theme**: write full file path on warnings [#699](https://github.com/McShelby/hugo-theme-relearn/issues/699)
- **theme**: show anchor link and copy to clipboard button on mobile [#697](https://github.com/McShelby/hugo-theme-relearn/issues/697)
- **config**: adjust to changes in Hugo 0.120 [#693](https://github.com/McShelby/hugo-theme-relearn/issues/693)
- **variants**: add more contrast to neon [#692](https://github.com/McShelby/hugo-theme-relearn/issues/692)
- **mermaid**: only show zoom reset button if zoomed [#691](https://github.com/McShelby/hugo-theme-relearn/issues/691)
- **menu**: add additional sort options [#684](https://github.com/McShelby/hugo-theme-relearn/issues/684)
- **theme**: add social media meta information [#683](https://github.com/McShelby/hugo-theme-relearn/issues/683)
- **theme**: simplify additional JS dependencies [#682](https://github.com/McShelby/hugo-theme-relearn/issues/682)
- **links**: warn if ref/relref is used falsly [#681](https://github.com/McShelby/hugo-theme-relearn/issues/681)
- **menu**: make width configurable [#677](https://github.com/McShelby/hugo-theme-relearn/issues/677)
- **tabs**: use color for link of inactive tabs [#675](https://github.com/McShelby/hugo-theme-relearn/issues/675)
- **taxonomy**: modularize term list generation [#671](https://github.com/McShelby/hugo-theme-relearn/issues/671)
- **theme**: remove warnings with `hugo --printI18nWarnings` [#670](https://github.com/McShelby/hugo-theme-relearn/issues/670)
- **theme**: implement portable linking [#377](https://github.com/McShelby/hugo-theme-relearn/issues/377)

Fixes

- **links**: extra space before link text [#700](https://github.com/McShelby/hugo-theme-relearn/issues/700)

- **[**bug**]** mermaid: reset zoom correctly [#690](https://github.com/McShelby/hugo-theme-relearn/issues/690)
- **[**bug**]** theme: fix mobile layout for width=48rem [#676](https://github.com/McShelby/hugo-theme-relearn/issues/676)
- **[**bug**]** frontmatter: resemble documented shortcode style [#672](https://github.com/McShelby/hugo-theme-relearn/issues/672)
- **[**bug**]** taxonomy: display terms in pages if `removePathAccents=true` [#669](https://github.com/McShelby/hugo-theme-relearn/issues/669)

Maintenance

- **[**task**]** mermaid: update mermaid to 10.6.0 [#703](https://github.com/McShelby/hugo-theme-relearn/issues/703)
- **[**task**]** openapi: update swagger-ui to 5.9.1 [#702](https://github.com/McShelby/hugo-theme-relearn/issues/702)

5.22.1 (2023-10-02)

Enhancements

- **[**feature**]** i18n: add Swahili translation [#666](https://github.com/McShelby/hugo-theme-relearn/issues/666)
- **[**feature**]** math: hide unrendered math [#663](https://github.com/McShelby/hugo-theme-relearn/issues/663)
- **[**feature**]** tabs: improve a11y by removing duplicate hidden title [#662](https://github.com/McShelby/hugo-theme-relearn/issues/662)
- **[**feature**]** mermaid: improve zoom UX [#659](https://github.com/McShelby/hugo-theme-relearn/issues/659)

Fixes

- **[**bug**]** variant: fix sidebar-flyout borders color for zen [#667](https://github.com/McShelby/hugo-theme-relearn/issues/667)
- **[**bug**]** clipboard: fix RTL location of tooltip [#661](https://github.com/McShelby/hugo-theme-relearn/issues/661)
- **[**bug**]** clipboard: ignore RTL for code [#660](https://github.com/McShelby/hugo-theme-relearn/issues/660)
- **[**bug**]** expand: fix aria-controls [#658](https://github.com/McShelby/hugo-theme-relearn/issues/658)
- **[**bug**]** theme: fix id generation for markdownified titles [#657](https://github.com/McShelby/hugo-theme-relearn/issues/657)
- **[**bug**]** mermaid: avoid graph bombing on hugo --minify [#656](https://github.com/McShelby/hugo-theme-relearn/issues/656)
- **[**bug**]** mermaid: fix width for some graphs [#655](https://github.com/McShelby/hugo-theme-relearn/issues/655)

5.22.0 (2023-09-26)

Enhancements

- **[**feature**]** mermaid: add pan&zoom reset [#651](https://github.com/McShelby/hugo-theme-relearn/issues/651)

- **feature** markdown: add interlace color for tables [#648](https://github.com/McShelby/hugo-theme-relearn/commit/00)
- **feature** search: add breadcrumb to dedicated search results [#647](https://github.com/McShelby/hugo-theme-relearn/commit/00)
- **feature****change** menu: optionally disable index pages for sections [#642](https://github.com/McShelby/hugo-theme-relearn/commit/00)

Fixes

- **bug** variants: restore generator zoom [#650](https://github.com/McShelby/hugo-theme-relearn/issues/650)
- **bug** clipboard: malused Fontawesome style [#649](https://github.com/McShelby/hugo-theme-relearn/issues/649)
- **bug****change** theme: avoid id collisions between headings and theme [#646](https://github.com/McShelby/hugo-theme-relearn/issues/646)
- **bug** theme: remove HTML validation errors [#644](https://github.com/McShelby/hugo-theme-relearn/issues/644)
- **bug** breadcrumb: remove superflous whitespace between items [#643](https://github.com/McShelby/hugo-theme-relearn/issues/643)

5.21.0 (2023-09-18)

Enhancements

- **feature** topbar: make buttons configurable [#639](https://github.com/McShelby/hugo-theme-relearn/issues/639)
- **feature****change** menu: fix footer padding [#637](https://github.com/McShelby/hugo-theme-relearn/issues/637)

Fixes

- **bug** breadcrumb: don't ignore spaces for separator [#636](https://github.com/McShelby/hugo-theme-relearn/issues/636)
- **bug** theme: fix snyk code issues [#633](https://github.com/McShelby/hugo-theme-relearn/issues/633)
- **bug** images: apply image effects to lightbox images [#631](https://github.com/McShelby/hugo-theme-relearn/issues/631)

Maintenance

- **task** openapi: update to swagger 5.7.2 [#641](https://github.com/McShelby/hugo-theme-relearn/issues/641)

5.20.0 (2023-08-26)

Enhancements

- ```
- [**feature**][**change**] theme: support for colored borders between menu and content [#626](https://github.com/McShelby/hugo-theme-openapi)
- [**feature**] image: allow option to apply image effects globally [#623](https://github.com/McShelby/hugo-theme-openapi)
- [**feature**][**change**] openapi: switch to light syntaxhighlighting where applicable [#621](https://github.com/McShelby/hugo-theme-openapi)
- [**feature**] images: document usage of images with links [#576](https://github.com/McShelby/hugo-theme-openapi)
Fixes
```

- ```
- [**bug**] highlight: fix rendering for Hugo < 0.111 [#630](https://github.com/McShelby/hugo-theme-reveal)
- [**bug**] search: remove link underline on dedicated search page [#627](https://github.com/McShelby/hugo-theme-reveal)
- [**bug**] highlight: don't switch to block view if hl_inline=true [#618](https://github.com/McShelby/hugo-theme-reveal)
- [**bug**] variant: minor adjustments to zen variants [#617](https://github.com/McShelby/hugo-theme-reveal)
- [**bug**] mermaid: lazy render graph if it is initially hidden [#187](https://github.com/McShelby/hugo-theme-reveal)
```

Maintenance

- **[**task**]** openapi: update to swagger 5.4.1 [#620](https://github.com/McShelby/hugo-theme-relearn/issue

— — —

```
## 5.19.0 (2023-08-12)
```

Enhancements

- ```
- [**feature**] highlight: add title parameter [#616](https://github.com/McShelby/hugo-theme-relearn/issues/616)
- [**feature**] variant: signal variant switch as event [#614](https://github.com/McShelby/hugo-theme-relearn/issues/614)
- [**feature**] variant: add zen variant in light and dark [#613](https://github.com/McShelby/hugo-theme-relearn/issues/613)
- [**feature**] i18n: add Hungarian translation [#604](https://github.com/McShelby/hugo-theme-relearn/issues/604)
- [**feature**] mermaid: update to 10.3.0 [#601](https://github.com/McShelby/hugo-theme-relearn/issues/601)
```

### ### Fixes

- ```
- [**bug**] siteparam: avoid halt if param is a map/slice [#611](https://github.com/McShelby/hugo-theme-relearn)
- [**bug**] mermaid: fix broken zoom since update to v10 [#608](https://github.com/McShelby/hugo-theme-relearn)
- [**bug**] mermaid: variant generator diagram does not respond to events [#607](https://github.com/McShelby/hugo-theme-relearn)
- [**bug**] print: avoid chroma leak for relearn-dark [#605](https://github.com/McShelby/hugo-theme-relearn)
### Maintenance
- [**task**] mermaid: update to 10.3.1 [#610](https://github.com/McShelby/hugo-theme-relearn/issues/610)
```

```
### Maintenance
```

- **[**task**]** mermaid: update to 10.3.1 [#610](https://github.com/McShelby/hugo-theme-relearn/issues/610)

5.18.0 (2023-07-27)

Enhancements

- **[**feature**][**change**]** shortcodes: add more deprecation warnings [#598](https://github.com/McShelby/hugo-theme-relearn/commit/598)
- **[**feature**][**change**]** shortcodes: change `context` parameter to `page` if called as partial [#595](https://github.com/McShelby/hugo-theme-relearn/commit/595)
- **[**feature**]** siteparam: support nested parameters and text formatting [#590](https://github.com/McShelby/hugo-theme-relearn/commit/590)
- **[**feature**][**change**]** a11y: improve when tabbing through links [#581](https://github.com/McShelby/hugo-theme-relearn/commit/581)

Fixes

- **[**bug**]** openapi: inherit RTL setting from Hugo content [#600](https://github.com/McShelby/hugo-theme-relearn/commit/600)
- **[**bug**]** 404: fix display in RTL [#597](https://github.com/McShelby/hugo-theme-relearn/issues/597)
- **[**bug**]** highlight: fix position of copy-to-clipboard button in RTL [#594](https://github.com/McShelby/hugo-theme-relearn/commit/594)
- **[**bug**]** openapi: fix spelling [#593](https://github.com/McShelby/hugo-theme-relearn/issues/593)
- **[**bug**]** search: fix typo in output format [#591](https://github.com/McShelby/hugo-theme-relearn/issues/591)
- **[**bug**]** tabs: fix tab selection by groupid [#582](https://github.com/McShelby/hugo-theme-relearn/issues/582)
- **[**bug**]** theme: restore compat with Hugo 0.95.0 [#580](https://github.com/McShelby/hugo-theme-relearn/commit/580)
- **[**bug**][**change**]** theme: improve display of links [#577](https://github.com/McShelby/hugo-theme-relearn/commit/577)

5.17.1 (2023-06-22)

Enhancements

- **[**feature**][**change**]** highlight: make copy to clipboard appear on hover [#574](https://github.com/McShelby/hugo-theme-relearn/commit/574)

5.17.0 (2023-06-22)

Enhancements

- **[**feature**]** highlight: add configurable line breaks [#169](https://github.com/McShelby/hugo-theme-relearn/commit/169)

Fixes

- **theme:** support Hugo 0.114.0 [#573](https://github.com/McShelby/hugo-theme-relearn/issues/573)
- **taxonomy:** fix number tags [#570](https://github.com/McShelby/hugo-theme-relearn/issues/570)
- **highlight:** improve copy to clipboard [#569](https://github.com/McShelby/hugo-theme-relearn/issues/569)

5.16.2 (2023-06-10)

Enhancements

- **theme:** revamp 404 page [#566](https://github.com/McShelby/hugo-theme-relearn/issues/566)

5.16.1 (2023-06-09)

Enhancements

- **theme:** add deprecation warnings [#565](https://github.com/McShelby/hugo-theme-relearn/issues/565)

Fixes

- **mermaid:** allow for YAML frontmatter inside of graph [#564](https://github.com/McShelby/hugo-theme-relearn/issues/564)
- **alias:** fix redirect URLs in case of empty BaseURL [#562](https://github.com/McShelby/hugo-theme-relearn/issues/562)

5.16.0 (2023-06-08)

Enhancements

- **tabs:** add title and icon option [#552](https://github.com/McShelby/hugo-theme-relearn/issues/552)
- **shortcodes:** add style option to mimic code box color scheme [#551](https://github.com/McShelby/hugo-theme-relearn/issues/551)
- **tabs:** support color options [#550](https://github.com/McShelby/hugo-theme-relearn/issues/550)
- **favicon:** add light & dark option for OS's preferred color scheme [#549](https://github.com/McShelby/hugo-theme-relearn/issues/549)

Fixes

- **[**bug**]** icon: remove whitespace on start [#560](https://github.com/McShelby/hugo-theme-relearn/issues/560)
- **[**bug**]** shortcodes: avoid superfluous margin at start and end of content [#558](https://github.com/McShelby/hugo-theme-relearn/issues/558)
- **[**bug**]** expand: fix html encoding of finishing content tag [#557](https://github.com/McShelby/hugo-theme-relearn/issues/557)
- **[**bug**]** icon: fix output "raw HTML omitted" with goldmark config unsafe=false [#555](https://github.com/McShelby/hugo-theme-relearn/issues/555)

5.15.2 (2023-05-29)

Enhancements

- **[**feature**]** taxonomy: add support for category default taxonomy [#541](https://github.com/McShelby/hugo-theme-relearn/issues/541)

Fixes

- **[**bug**]** attachments: work for Hugo < 0.112 [#546](https://github.com/McShelby/hugo-theme-relearn/issues/546)

5.15.1 (2023-05-25)

Fixes

- **[**bug**]** shortcodes: intermediately use random ids instead of .Ordinal [#543](https://github.com/McShelby/hugo-theme-relearn/issues/543)

5.15.0 (2023-05-25)

Enhancements

- **[**feature**]** tab: new shortcode to display single tab [#538](https://github.com/McShelby/hugo-theme-relearn/issues/538)
- **[**feature**][**change**]** tabs: treat groupid as unique if not set [#537](https://github.com/McShelby/hugo-theme-relearn/issues/537)
- **[**feature**]** expand: indent expanded content [#536](https://github.com/McShelby/hugo-theme-relearn/issues/536)

- **feature** notice: make boxes more prominent [#535](https://github.com/McShelby/hugo-theme-relearn/issues/535)

Fixes

- **bug** attachments: fix build error since Hugo 0.112 [#540](https://github.com/McShelby/hugo-theme-relearn/issues/540)

Maintenance

- **task** chore: update Mermaid to 9.4.3 [#534](https://github.com/McShelby/hugo-theme-relearn/issues/534)
- **task** mermaid: update to 10.2.0 [#499](https://github.com/McShelby/hugo-theme-relearn/issues/499)

5.14.3 (2023-05-20)

Fixes

- **bug** tags: show taxonomy toc for standard installation [#533](https://github.com/McShelby/hugo-theme-relearn/issues/533)

5.14.2 (2023-05-20)

Fixes

- **bug** tags: translate breadcrumb and title for taxonomy [#532](https://github.com/McShelby/hugo-theme-relearn/issues/532)

5.14.1 (2023-05-20)

No changelog for this release.

5.14.0 (2023-05-19)

Enhancements

- **feature** tags: improve search index for tags [#531](https://github.com/McShelby/hugo-theme-relearn/issues/531)

- **feature** tags: increase readability of taxonomy pages [#530](https://github.com/McShelby/hugo-theme-relearn/commit/530)
- **feature** nav: make breadcrumb separator configurable [#529](https://github.com/McShelby/hugo-theme-relearn/commit/529)
- **feature** i18n: add translation for default taxonomies [#528](https://github.com/McShelby/hugo-theme-relearn/commit/528)
- **feature** theme: set appropriate defaults for all theme specific params [#516](https://github.com/McShelby/hugo-theme-relearn/commit/516)
- **feature** theme: allow to display tags below article [#513](https://github.com/McShelby/hugo-theme-relearn/commit/513)

Fixes

- **bug** shortcode: make .context always a page [#527](https://github.com/McShelby/hugo-theme-relearn/commit/527)

5.13.2 (2023-05-17)

Fixes

- **bug** print: enable print for pages with _build options [#522](https://github.com/McShelby/hugo-theme-relearn/commit/522)

5.13.1 (2023-05-16)

Fixes

- **bug** openapi: allow toc to scroll page [#526](https://github.com/McShelby/hugo-theme-relearn/commit/526)

5.13.0 (2023-05-14)

Enhancements

- **feature****change** openapi: replace implementation with swagger-ui [#523](https://github.com/McShelby/hugo-theme-relearn/commit/523)

Fixes

- **bug** variant: avoid leaking shadows in neon print style [#524](https://github.com/McShelby/hugo-theme-relearn/commit/524)

5.12.6 (2023-05-04)

Enhancements

- **feature** theme: better HTML titles and breadcrumbs for search and tag pages [#521](https://github.com/McShelby/hugo-theme-mcshelby)

Fixes

- **bug** menu: avoid hiding of expander on hover when active item has children [#520](https://github.com/McShelby/hugo-theme-mcshelby)
- **bug** menu: showVisitedLinks not working for some theme variants [#518](https://github.com/McShelby/hugo-theme-mcshelby)
- **bug** theme: fix resource URLs for 404 page on subdirectories [#515](https://github.com/McShelby/hugo-theme-mcshelby)

5.12.5 (2023-03-28)

Fixes

- **bug** expand: not properly expanded when used in bullet point list [#508](https://github.com/McShelby/hugo-theme-mcshelby)

5.12.4 (2023-03-24)

Fixes

- **bug** theme: disableExplicitIndexURLs param is not working as expected [#505](https://github.com/McShelby/hugo-theme-mcshelby)

5.12.3 (2023-03-14)

Fixes

- **bug** attachments: fix links if only one language is present [#503](https://github.com/McShelby/hugo-theme-mcshelby)
- **bug** shortcodes: allow markdown for title and content [#502](https://github.com/McShelby/hugo-theme-mcshelby)

5.12.2 (2023-03-03)

Fixes

- **bug** menu: fix state for alwaysopen=false + collapsibleMenu=false [#498](https://github.com/McShelby/hugo-theme-relearn/issues/498)

5.12.1 (2023-02-26)

Enhancements

- **feature** variant: add relearn bright theme [#493](https://github.com/McShelby/hugo-theme-relearn/issues/493)

Fixes

- **bug** generator: fix setting of colors [#494](https://github.com/McShelby/hugo-theme-relearn/issues/494)

5.12.0 (2023-02-24)

Enhancements

- **feature** frontmatter: support VSCode Front Matter extension [#481](https://github.com/McShelby/hugo-theme-relearn/pull/481)
- **feature** theme: make expand and image ids stable [#477](https://github.com/McShelby/hugo-theme-relearn/pull/477)
- **feature** variant: set scrollbar color to dark for dark variants [#471](https://github.com/McShelby/hugo-theme-relearn/pull/471)
- **feature** i18n: add full RTL support [#470](https://github.com/McShelby/hugo-theme-relearn/issues/470)
- **feature** piratify: fix some quirks, arrr [#469](https://github.com/McShelby/hugo-theme-relearn/issues/469)
- **feature****change** theme: optimization for huge screen sizes [#466](https://github.com/McShelby/hugo-theme-relearn/pull/466)

Fixes

- **bug** i18n: write code ltr even for rtl languages [#492](https://github.com/McShelby/hugo-theme-relearn/pull/492)

- **bug** anchor: fix link in FF when served from file system [#482](https://github.com/McShelby/hugo-theme-relearn/commit/00)
- **bug** shortcodes: don't break build and render for invalid parameters [#480](https://github.com/McShelby/hugo-theme-relearn/commit/00)
- **bug** nav: restore scroll position on browser back [#476](https://github.com/McShelby/hugo-theme-relearn/commit/00)
- **bug** variant: avoid style leak for auto style [#473](https://github.com/McShelby/hugo-theme-relearn/commit/00)

Maintenance

- **task** build: add imagebot [#485](https://github.com/McShelby/hugo-theme-relearn/issues/485)

5.11.2 (2023-02-07)

Fixes

- **bug** tabs: nested tabs content is not displayed [#468](https://github.com/McShelby/hugo-theme-relearn/commit/00)

5.11.1 (2023-02-06)

Fixes

- **bug** variant: include missing `theme-auto.css` in distribution [#467](https://github.com/McShelby/hugo-theme-relearn/commit/00)

5.11.0 (2023-02-05)

Enhancements

- **feature** i18n: add Czech translation [#455](https://github.com/McShelby/hugo-theme-relearn/issues/455)
- **feature****change** lightbox: switch to CSS-only solution [#451](https://github.com/McShelby/hugo-theme-relearn/commit/00)
- **feature****change** variant: add support for `prefers-color-scheme` [#445](https://github.com/McShelby/hugo-theme-relearn/commit/00)
- **feature****change** expand: refactor for a11y [#339](https://github.com/McShelby/hugo-theme-relearn/commit/00)

- **feature** **change** mermaid: make zoom configurable [#144](https://github.com/McShelby/hugo-theme-relearn)

Fixes

- **bug** swagger: avoid errors when using invalid rapi-doc fragment ids [#465](https://github.com/McShelby/hugo-theme-relearn)
- **bug** search: fix oddities in keyboard handling [#463](https://github.com/McShelby/hugo-theme-relearn)
- **bug** badge: fix text color for IE11 [#462](https://github.com/McShelby/hugo-theme-relearn/issues/462)
- **bug** mermaid: rerender graph if search term is present and variant is switched [#460](https://github.com/McShelby/hugo-theme-relearn)
- **bug** tags: show tag on pages when tag has space [#459](https://github.com/McShelby/hugo-theme-relearn)
- **bug** edit: remove double slash on root page link [#450](https://github.com/McShelby/hugo-theme-relearn)

Maintenance

- **task** build: add moving version tags [#453](https://github.com/McShelby/hugo-theme-relearn/issues/453)
- **task** **change** theme: remove jQuery [#452](https://github.com/McShelby/hugo-theme-relearn/issues/452)
- **task** build: check for release notes before release [#448](https://github.com/McShelby/hugo-theme-relearn)

5.10.2 (2023-01-25)

Fixes

- **bug** nav: fix breadcrumb for huge installations [#446](https://github.com/McShelby/hugo-theme-relearn)

5.10.1 (2023-01-25)

Fixes

- **bug** print: fix image links with relative path [#444](https://github.com/McShelby/hugo-theme-relearn)

5.10.0 (2023-01-25)

Enhancements

- **feature** shortcodes: support for accent color [#440](https://github.com/McShelby/hugo-theme-relearn)
- **feature** shortcodes: add color parameter where applicable [#438](https://github.com/McShelby/hugo-theme-relearn)
- **feature** theme: announce translations as alternate links [#422](https://github.com/McShelby/hugo-theme-relearn)

Fixes

- **bug** nav: fix breadcrumbs for deeply nested sections [#442](https://github.com/McShelby/hugo-theme-relearn)
- **bug** theme: improve whitespacing in tables [#441](https://github.com/McShelby/hugo-theme-relearn)

5.9.4 (2023-01-23)

Fixes

- **bug** variant: fix search icon and text color [#437](https://github.com/McShelby/hugo-theme-relearn)

5.9.3 (2023-01-22)

Fixes

- **bug** nav: fix left/right navigation for horizontal scrolling [#435](https://github.com/McShelby/hugo-theme-relearn)
- **bug****breaking** theme: allow pages on top level [#434](https://github.com/McShelby/hugo-theme-relearn)

Maintenance

- **task** build: switch to wildcard version of actions [#428](https://github.com/McShelby/hugo-theme-relearn)

5.9.2 (2022-12-30)

Fixes

- **bug** search: apply dependency scripts for Hindi and Japanese [#427](https://github.com/McShelby/hugo-theme-relearn)

5.9.1 (2022-12-23)

Enhancements

- **feature** theme: make external link target configurable [#426](https://github.com/McShelby/hugo-theme-relearn/issues/426)
-

5.9.0 (2022-12-23)

Enhancements

- **feature****change** theme: open external links in separate tab [#419](https://github.com/McShelby/hugo-theme-relearn/issues/419)
- **feature** theme: make it a Hugo module [#417](https://github.com/McShelby/hugo-theme-relearn/issues/417)

Fixes

- **bug****change** attachments: fix incorrect links for defaultContentLanguageInSubdir=true [#425](https://github.com/McShelby/hugo-theme-relearn/issues/425)

5.8.1 (2022-12-11)

Fixes

- **bug** theme: fix alias for home page if defaultContentLanguageInSubdir=true [#414](https://github.com/McShelby/hugo-theme-relearn/issues/414)

5.8.0 (2022-12-08)

Enhancements

- **feature** icon: add new shortcode [#412](https://github.com/McShelby/hugo-theme-relearn/issues/412)

- **feature** theme: style and document markdown extensions [#411](https://github.com/McShelby/hugo-theme-relearn/issues/411)
- **feature** badge: add new shortcode [#410](https://github.com/McShelby/hugo-theme-relearn/issues/410)
- **feature** theme: add accent color [#409](https://github.com/McShelby/hugo-theme-relearn/issues/409)

Fixes

- **bug** theme: fix spacing for tag flyout in FF [#413](https://github.com/McShelby/hugo-theme-relearn/issues/413)

5.7.0 (2022-11-29)

Enhancements

- **feature** button: refactor for a11y [#372](https://github.com/McShelby/hugo-theme-relearn/issues/372)

Fixes

- **bug** search: don't freeze browser on long search terms [#408](https://github.com/McShelby/hugo-theme-relearn/issues/408)
- **bug** search: fix searchbox placeholder color in FF and IE [#405](https://github.com/McShelby/hugo-theme-relearn/issues/405)
- **bug****change** i18n: rename Korean translation from country to lang code [#404](https://github.com/McShelby/hugo-theme-relearn/issues/404)

Maintenance

- **task** search: update lunr languages to 1.10.0 [#403](https://github.com/McShelby/hugo-theme-relearn/issues/403)

5.6.6 (2022-11-23)

Enhancements

- **feature** search: make build and js forgiving against config errors [#400](https://github.com/McShelby/hugo-theme-relearn/issues/400)

Fixes

- **bug** variant: minor color adjustments [#402](https://github.com/McShelby/hugo-theme-relearn/issues/402)
- **bug** variant: fix generator for use of neon [#401](https://github.com/McShelby/hugo-theme-relearn/issues/401)

5.6.5 (2022-11-19)

Fixes

- **[**bug**]** menu: relax usage of background color [#399](https://github.com/McShelby/hugo-theme-relearn/issues/399)

5.6.4 (2022-11-19)

Fixes

- **[**bug**]** theme: make alias pages usable by file:// protocol [#398](https://github.com/McShelby/hugo-theme-relearn/issues/398)

5.6.3 (2022-11-19)

Fixes

- **[**bug**]** theme: be compatible with Hugo >= 0.95.0 [#397](https://github.com/McShelby/hugo-theme-relearn/issues/397)

5.6.2 (2022-11-19)

Fixes

- **[**bug**]** theme: build breaks sites without "output" section in config [#396](https://github.com/McShelby/hugo-theme-relearn/issues/396)

5.6.1 (2022-11-19)

Fixes

- **[**bug**]** theme: fix image distortion [#395](https://github.com/McShelby/hugo-theme-relearn/issues/395)

5.6.0 (2022-11-18)

Enhancements

- **[**feature**]** toc: improve keyboard handling [#390](https://github.com/McShelby/hugo-theme-relearn/issues/390)
- **[**feature**]** search: improve keyboard handling [#387](https://github.com/McShelby/hugo-theme-relearn/issues/387)
- **[**feature**]** search: add dedicated search page [#386](https://github.com/McShelby/hugo-theme-relearn/issues/386)
- **[**feature**]** theme: make creation of generator meta tag configurable [#383](https://github.com/McShelby/hugo-theme-relearn/issues/383)
- **[**feature**]** theme: increase build performance [#380](https://github.com/McShelby/hugo-theme-relearn/issues/380)

Fixes

- **[**bug**]** mermaid: avoid leading whitespace [#394](https://github.com/McShelby/hugo-theme-relearn/issues/394)
- **[**bug**]** theme: fix build errors when referencing SVGs in markdown [#393](https://github.com/McShelby/hugo-theme-relearn/issues/393)
- **[**bug**]** variant: avoid neon to leak into IE11 fallback [#392](https://github.com/McShelby/hugo-theme-relearn/issues/392)
- **[**bug**]** theme: fix urls for file:// protocol in sitemap [#385](https://github.com/McShelby/hugo-theme-relearn/issues/385)
- **[**bug**]** theme: add id to h1 elements [#384](https://github.com/McShelby/hugo-theme-relearn/issues/384)
- **[**bug**]** rss: fix display of hidden subpages [#382](https://github.com/McShelby/hugo-theme-relearn/issues/382)
- **[**bug**]** nav: fix key navigation when pressing wrong modifiers [#379](https://github.com/McShelby/hugo-theme-relearn/issues/379)

Maintenance

- **[**task**]** mermaid: update to version 9.2.2 [#391](https://github.com/McShelby/hugo-theme-relearn/issues/391)

5.5.3 (2022-11-10)

Fixes

- **[**bug**]** tags: fix non-latin tag display on pages [#378](https://github.com/McShelby/hugo-theme-relearn/issues/378)

5.5.2 (2022-11-08)

Fixes

- **theme: fix typo in 404.html** [#376](https://github.com/McShelby/hugo-theme-relearn/issues/376)
- **theme: allow menu items and children to be served by file:// protocol** [#375](https://github.com/McShelby/hugo-theme-relearn/issues/375)

5.5.1 (2022-11-07)

Fixes

- **theme: fix overflowing issue with anchors and tooltips** [#364](https://github.com/McShelby/hugo-theme-relearn/issues/364)

5.5.0 (2022-11-06)

Enhancements

- **optimize page load for images** [#304](https://github.com/McShelby/hugo-theme-relearn/issues/304)

Fixes

- **theme: fix context in render hooks** [#373](https://github.com/McShelby/hugo-theme-relearn/issues/373)
- **print: make canonical URL absolute** [#371](https://github.com/McShelby/hugo-theme-relearn/issues/371)

5.4.3 (2022-11-05)

Enhancements

- **history: refactor for a11y** [#341](https://github.com/McShelby/hugo-theme-relearn/issues/341)

Fixes

- **theme: fix multilang links when site served from subdirectory** [#370](https://github.com/McShelby/hugo-theme-relearn/issues/370)

5.4.2 (2022-11-05)

Maintenance

- **[**task**]** build: change set-output to env vars [#348](https://github.com/McShelby/hugo-theme-relearn/issues/348)

5.4.1 (2022-11-05)

Fixes

- **[**bug**]** mermaid: fix Gantt chart width [#365](https://github.com/McShelby/hugo-theme-relearn/issues/365)

5.4.0 (2022-11-01)

Enhancements

- **[**feature**]** math: allow passing of parameters with codefence syntax [#363](https://github.com/McShelby/hugo-theme-relearn/issues/363)
- **[**feature**]** i18n: add Finnish translation [#361](https://github.com/McShelby/hugo-theme-relearn/issues/361)
- **[**feature**]** mermaid: allow passing of parameters with codefence syntax [#360](https://github.com/McShelby/hugo-theme-relearn/issues/360)
- **[**feature**]** i18n: support RTL [#357](https://github.com/McShelby/hugo-theme-relearn/issues/357)
- **[**feature**][**change**]** button: add option for target [#351](https://github.com/McShelby/hugo-theme-relearn/issues/351)
- **[**feature**][**change**]** theme: allow to be served by file:// protocol [#349](https://github.com/McShelby/hugo-theme-relearn/issues/349)

5.3.3 (2022-10-09)

Fixes

- **[**bug**]** archetypes: fix frontmatter on home.md template [#346](https://github.com/McShelby/hugo-theme-relearn/issues/346)

5.3.2 (2022-10-08)

Fixes

- **bug** nav: change defunct keyboard shortcuts [#344](https://github.com/McShelby/hugo-theme-relearn/)

5.3.1 (2022-10-08)

Enhancements

- **bug** print: disable arrow navigation [#294](https://github.com/McShelby/hugo-theme-relearn/issues/294)
- **bug** print: add missing page break after index or section [#292](https://github.com/McShelby/hugo-theme-relearn/issues/292)
- **bug** theme: use more space on wide screens [#291](https://github.com/McShelby/hugo-theme-relearn/issues/291)
- **bug** theme: fix size of chapter heading [#289](https://github.com/McShelby/hugo-theme-relearn/issues/289)

Maintenance

- **task** chore: update RapiDoc 9.3.3 [#301](https://github.com/McShelby/hugo-theme-relearn/issues/301)
- **task** chore: update Mermaid 9.1.3 [#293](https://github.com/McShelby/hugo-theme-relearn/issues/293)

4.2.5 (2022-06-23)

Fixes

- **bug** swagger: javascript code does not load in documentation [#285](https://github.com/McShelby/hugo-theme-relearn/issues/285)
- **bug** children: descriptions not working [#284](https://github.com/McShelby/hugo-theme-relearn/issues/284)
- **bug** print: fix empty page for shortcut links [#283](https://github.com/McShelby/hugo-theme-relearn/issues/283)

4.2.4 (2022-06-23)

Fixes

- **bug** theme: fix url for logo and home button [#282](https://github.com/McShelby/hugo-theme-relearn/issues/282)

4.2.3 (2022-06-23)

Fixes

- **bug****breaking** include: second parameter is ignored [#281](https://github.com/McShelby/hugo-theme-relearn/issues/281)

4.2.2 (2022-06-23)

No changelog for this release.

4.2.1 (2022-06-23)

No changelog for this release.

4.2.0 (2022-06-23)

Enhancements

- **feature** **change** tabs: don't change tab selection if panel does not contain item [#279](https://github.com/McShelby/hugo-theme-relearn/issues/279)
- **feature** shortcodes: convert to partials [#277](https://github.com/McShelby/hugo-theme-relearn/issues/277)

Fixes

- **bug** swagger: avoid builtin syntaxhighlighting [#280](https://github.com/McShelby/hugo-theme-relearn/issues/280)
- **bug** search: fix console message for missing lunr translations [#278](https://github.com/McShelby/hugo-theme-relearn/issues/278)
- **bug** tabs: fix wrapping when having many tabs [#272](https://github.com/McShelby/hugo-theme-relearn/issues/272)

4.1.1 (2022-06-18)

Fixes

- **bug** notice: fix layout when content starts with heading [#275](https://github.com/McShelby/hugo-theme-relearn/issues/275)

4.1.0 (2022-06-12)

Enhancements

- **feature** i18n: support multilang content [#271](https://github.com/McShelby/hugo-theme-relearn/issues/271)

4.0.5 (2022-06-12)

Fixes

- **bug** i18n: Vietnamese language with wrong lang code [#270](https://github.com/McShelby/hugo-theme-relearn/issues/270)
- **bug** i18n: fix search for non western languages [#269](https://github.com/McShelby/hugo-theme-relearn/issues/269)

4.0.4 (2022-06-07)

Enhancements

- **feature** theme: improve keyboard navigation for scrolling [#268](https://github.com/McShelby/hugo-theme-relearn/issues/268)

Fixes

- **bug** swagger: adjust font-size for method buttons [#267](https://github.com/McShelby/hugo-theme-relearn/issues/267)
- **bug** menu: hide expander when only hidden subpages [#264](https://github.com/McShelby/hugo-theme-relearn/issues/264)
- **bug** theme: make compatible with Hugo 0.100.0 [#263](https://github.com/McShelby/hugo-theme-relearn/issues/263)

Maintenance

- **task** swagger: update rapidoc to 9.3.2 [#266](https://github.com/McShelby/hugo-theme-relearn/issues/266)
- **task** mermaid: update to 9.1.1 [#265](https://github.com/McShelby/hugo-theme-relearn/issues/265)

4.0.3 (2022-06-05)

Enhancements

- **feature** toc: add scrollbar [#262](https://github.com/McShelby/hugo-theme-relearn/issues/262)

4.0.2 (2022-06-05)

Fixes

- **theme**: let browser scroll page on CTRL+f [#242](https://github.com/McShelby/hugo-theme-relearn/commit/00)

4.0.1 (2022-06-05)

No changelog for this release.

4.0.0 (2022-06-05)

Enhancements

- **shortcodes**: add named parameter if missing [#260](https://github.com/McShelby/hugo-theme-relearn/commit/00)
- **theme**: remove --MAIN-ANCHOR-color from stylesheet [#256](https://github.com/McShelby/hugo-theme-relearn/commit/00)
- **i18n**: add Italian translation [#254](https://github.com/McShelby/hugo-theme-relearn/commit/00)
- **attachments**: support for brand colors [#252](https://github.com/McShelby/hugo-theme-relearn/commit/00)
- **notice**: support for brand colors [#251](https://github.com/McShelby/hugo-theme-relearn/commit/00)
- **config**: remove custom_css [#248](https://github.com/McShelby/hugo-theme-relearn/commit/00)
- **theme**: use proper file extension for page-meta.go [#246](https://github.com/McShelby/hugo-theme-relearn/commit/00)
- **variant**: add support for brand color variables [#239](https://github.com/McShelby/hugo-theme-relearn/commit/00)
- **i18n**: add Polish translation [#237](https://github.com/McShelby/hugo-theme-relearn/commit/00)

Fixes

- **shortcodes**: accept boolean parameters if given as string [#261](https://github.com/McShelby/hugo-theme-relearn/commit/00)
- **print**: adjust button and tab size [#259](https://github.com/McShelby/hugo-theme-relearn/commit/00)
- **print**: show Mermaid if requested in frontmatter [#255](https://github.com/McShelby/hugo-theme-relearn/commit/00)
- **theme**: adjust thin scrollbar slider [#244](https://github.com/McShelby/hugo-theme-relearn/commit/00)
- **mobile**: fix broken scrollbar [#243](https://github.com/McShelby/hugo-theme-relearn/commit/00)
- **theme**: fix display of tooltip for heading anchor [#241](https://github.com/McShelby/hugo-theme-relearn/commit/00)

3.4.1 (2022-04-03)

Fixes

- **theme:** fix IE11 incompatibilities [#234](https://github.com/McShelby/hugo-theme-relearn/issues/234)

3.4.0 (2022-04-03)

Enhancements

- **i18n:** add Traditional Chinese translation [#233](https://github.com/McShelby/hugo-theme-relearn/pull/233)
- **menu:** expand/collapse menu items without navigation [#231](https://github.com/McShelby/hugo-theme-relearn/pull/231)
- **print:** add option to print whole chapter [#230](https://github.com/McShelby/hugo-theme-relearn/pull/230)
- **theme:** apply user supplied content footer below content [#229](https://github.com/McShelby/hugo-theme-relearn/pull/229)

Fixes

- **theme:** scroll to heading on initial load [#232](https://github.com/McShelby/hugo-theme-relearn/pull/232)

3.3.0 (2022-03-28)

Enhancements

- **theme:** add CSS font variables [#227](https://github.com/McShelby/hugo-theme-relearn/issues/227)
- **swagger:** add support for oas/swagger documentation [#226](https://github.com/McShelby/hugo-theme-relearn/pull/226)

Fixes

- **variant:** make variant switch work on slow networks [#228](https://github.com/McShelby/hugo-theme-relearn/pull/228)

3.2.1 (2022-03-25)

Fixes

- **[**bug**]** print: fix minor inconsistencies [#225](https://github.com/McShelby/hugo-theme-relearn/issues/225)
- **[**bug**]** print: show more than just the title page [#224](https://github.com/McShelby/hugo-theme-relearn/issues/224)
- **[**bug**]** theme: align content scrollbar to the right on big screens [#223](https://github.com/McShelby/hugo-theme-relearn/issues/223)

3.2.0 (2022-03-19)

Enhancements

- **[**feature**]****[**change**]** mermaid: support differing themes for color variant switch [#219](https://github.com/McShelby/hugo-theme-relearn/issues/219)
- **[**feature**]** mermaid: load javascript on demand [#218](https://github.com/McShelby/hugo-theme-relearn/issues/218)

Maintenance

- **[**task**]** mermaid: update to 8.14.0 [#220](https://github.com/McShelby/hugo-theme-relearn/issues/220)

3.1.1 (2022-03-16)

Enhancements

- **[**feature**]** i18n: add Korean translation [#217](https://github.com/McShelby/hugo-theme-relearn/issues/217)

3.1.0 (2022-03-15)

Enhancements

- **[**feature**]** notice: add icon parameter [#212](https://github.com/McShelby/hugo-theme-relearn/issues/212)
- **[**feature**]** mobile: remove breadcrumb ellipsis [#211](https://github.com/McShelby/hugo-theme-relearn/issues/211)

Fixes

- **[**bug**]** theme: make storage of multiple Hugo sites on same server distinct [#214](https://github.com/McShelby/hugo-theme-relearn/issues/214)

- **variant:** switch breadcrumb color in Chrome [#213](https://github.com/McShelby/hugo-theme-relearn/commit/00)
- **mobile:** improve behavior of sidebar menu [#210](https://github.com/McShelby/hugo-theme-relearn/commit/00)

3.0.4 (2022-02-24)

Enhancements

- **theme:** improve font loading [#201](https://github.com/McShelby/hugo-theme-relearn/issues/201)
- **variant:** fix inconsistent color variable naming [#200](https://github.com/McShelby/hugo-theme-relearn/commit/00)

Fixes

- **variant:** fix occasional fail when resetting generator [#208](https://github.com/McShelby/hugo-theme-relearn/commit/00)
- **docs:** don't move header on logo hover in IE11 [#207](https://github.com/McShelby/hugo-theme-relearn/commit/00)
- **variant:** avoid flash of menu header when non default variant is active [#206](https://github.com/McShelby/hugo-theme-relearn/commit/00)
- **theme:** fix wrong HTML closing tag order in chapters [#205](https://github.com/McShelby/hugo-theme-relearn/commit/00)
- **theme:** adjust breadcrumb and title for empty home page titles [#202](https://github.com/McShelby/hugo-theme-relearn/commit/00)

3.0.3 (2022-02-23)

Enhancements

- **tags:** show tag count in taxonomy list [#195](https://github.com/McShelby/hugo-theme-relearn/commit/00)

Fixes

- **theme:** remove Hugo build warning if page is not file based [#197](https://github.com/McShelby/hugo-theme-relearn/commit/00)
- **tags:** adhere to titleSeparator [#196](https://github.com/McShelby/hugo-theme-relearn/issues/196)
- **theme:** hide footer divider and variant selector in IE11 [#194](https://github.com/McShelby/hugo-theme-relearn/commit/00)

3.0.2 (2022-02-23)

Enhancements

- **feature** tags: sort by name [#193](https://github.com/McShelby/hugo-theme-relearn/issues/193)

3.0.1 (2022-02-23)

Enhancements

- **feature** children: set containerstyle automatically according to style [#192](https://github.com/McShelby/hugo-theme-relearn/issues/192)

Fixes

- **bug** theme: revert fontawesome to version 5 for IE11 compat [#191](https://github.com/McShelby/hugo-theme-relearn/issues/191)

3.0.0 (2022-02-22)

Enhancements

- **feature** variant: build a variant generator [#188](https://github.com/McShelby/hugo-theme-relearn/issues/188)
- **feature** nav: only show toc if the page has headings [#182](https://github.com/McShelby/hugo-theme-relearn/issues/182)
- **feature****breaking** theme: change default colors to Relearn defaults [#181](https://github.com/McShelby/hugo-theme-relearn/issues/181)
- **feature** variant: add a variant selector [#178](https://github.com/McShelby/hugo-theme-relearn/issues/178)
- **feature****breaking** menu: rework footer UX [#177](https://github.com/McShelby/hugo-theme-relearn/issues/177)
- **feature** theme: support for dark mode [#175](https://github.com/McShelby/hugo-theme-relearn/issues/175)
- **feature** docs: use light syntax highlighting theme [#174](https://github.com/McShelby/hugo-theme-relearn/issues/174)
- **feature** notice: tweak dull colors [#173](https://github.com/McShelby/hugo-theme-relearn/issues/173)
- **feature** theme: rework header UX [#151](https://github.com/McShelby/hugo-theme-relearn/issues/151)

Fixes

- **bug** search: remove additional X in filled out search box in IE11 [#190](https://github.com/McShelby/hugo-theme-relearn/issues/190)
- **bug** clipboard: localize tooltips [#186](https://github.com/McShelby/hugo-theme-relearn/issues/186)
- **bug** print: hide sidebar on Mac [#183](https://github.com/McShelby/hugo-theme-relearn/issues/183)
- **bug** menu: fix scrollbar height [#180](https://github.com/McShelby/hugo-theme-relearn/issues/180)

- **[**bug**][**change**]** search: fix color change for icons on hover [#176](https://github.com/McShelby/hugo-theme-relearn/issues/176)

2.9.6 (2022-02-07)

Fixes

- **[**bug**]** menu: remove debug output [#171](https://github.com/McShelby/hugo-theme-relearn/issues/171)

2.9.5 (2022-02-07)

Fixes

- **[**bug**]** menu: let arrow navigation respect ordersectionsby configuration [#170](https://github.com/McShelby/hugo-theme-relearn/issues/170)

2.9.4 (2022-02-06)

Fixes

- **[**bug**]** exampleSite: fix links in official documentation [#168](https://github.com/McShelby/hugo-theme-relearn/issues/168)

2.9.3 (2022-02-06)

Fixes

- **[**bug**]** menu: invalid URL when the shortcut is an internal link [#163](https://github.com/McShelby/hugo-theme-relearn/issues/163)

2.9.2 (2021-11-26)

Enhancements

- **feature** theme: add theme version info to head [#158](https://github.com/McShelby/hugo-theme-relearn)

Fixes

- **bug** theme: fix selection of *.ico files as favicons [#160](https://github.com/McShelby/hugo-theme-relearn)

2.9.1 (2021-11-22)

Fixes

- **bug** menu: fix significantly low performance for collecting of meta info [#157](https://github.com/McShelby/hugo-theme-relearn)

2.9.0 (2021-11-19)

Fixes

- **bug****breaking** relref: fix inconsistent behavior [#156](https://github.com/McShelby/hugo-theme-relearn)
- **bug** search: make dropdown stick to search field when scrolling [#155](https://github.com/McShelby/hugo-theme-relearn)
- **bug** menu: align long text properly [#154](https://github.com/McShelby/hugo-theme-relearn/issues/154)
- **bug** copyToClipboard: add missing right border for inline code if `disableInlineCopyToClipboard=true`
- **bug** menu: show hidden sibling pages reliably [#152](https://github.com/McShelby/hugo-theme-relearn)
- **bug** menu: bring active item in sight for large menus [#149](https://github.com/McShelby/hugo-theme-relearn)

2.8.3 (2021-11-09)

Fixes

- **bug** mermaid: let zoom reset to initial size [#145](https://github.com/McShelby/hugo-theme-relearn)
- **bug** mermaid: remove whitespace from big graphs [#143](https://github.com/McShelby/hugo-theme-relearn)

2.8.2 (2021-11-08)

Fixes

- **bug** mermaid: always load javascript to avoid break if code fences are used [#142](https://github.com/McShelby/hugo-theme-relearn/issues/142)

2.8.1 (2021-11-04)

Fixes

- **bug** search: don't break JS in multilang setup if search is disabled [#140](https://github.com/McShelby/hugo-theme-relearn/issues/140)

2.8.0 (2021-11-03)

Enhancements

- **feature** toc: make disableTOC globally available via config.toml [#133](https://github.com/McShelby/hugo-theme-relearn/issues/133)
- **feature** mermaid: only load javascript if necessary [#95](https://github.com/McShelby/hugo-theme-relearn/issues/95)
- **feature** **change** theme: switch font [#83](https://github.com/McShelby/hugo-theme-relearn/issues/83)
- **feature** theme: make favicon configurable [#2](https://github.com/McShelby/hugo-theme-relearn/issues/2)

Fixes

- **bug** mermaid: assert that window.mermaid is actually mermaid [#136](https://github.com/McShelby/hugo-theme-relearn/issues/136)
- **bug** menu: remove usage of Hugo's UniqueID [#131](https://github.com/McShelby/hugo-theme-relearn/issues/131)
- **bug** theme: reduce margin for children shortcode [#130](https://github.com/McShelby/hugo-theme-relearn/issues/130)
- **bug** theme: left-align h3 in chapters [#129](https://github.com/McShelby/hugo-theme-relearn/issues/129)
- **bug** theme: align copy link to clipboard [#128](https://github.com/McShelby/hugo-theme-relearn/issues/128)

2.7.0 (2021-10-24)

Enhancements

- **feature** notice: support custom titles [#124](https://github.com/McShelby/hugo-theme-relearn/issues/124)

2.6.0 (2021-10-21)

Fixes

- **bug** theme: generate correct links if theme served from subdirectory [#120](https://github.com/McShelby/hugo-theme-relearn/issues/120)

2.5.1 (2021-10-12)

Fixes

- **bug** security: fix XSS for malicious image URLs [#117](https://github.com/McShelby/hugo-theme-relearn/issues/117)

2.5.0 (2021-10-08)

Enhancements

- **feature****change** syntax highlight: provide default colors for unknown languages [#113](https://github.com/McShelby/hugo-theme-relearn/issues/113)

Fixes

- **bug** security: fix XSS for malicious URLs [#114](https://github.com/McShelby/hugo-theme-relearn/issues/114)
- **bug** menu: write correct local shortcut links [#112](https://github.com/McShelby/hugo-theme-relearn/issues/112)

2.4.1 (2021-10-07)

Fixes

- **[**bug**]** theme: remove runtime styles from print [#111](https://github.com/McShelby/hugo-theme-relearn/)
-

2.4.0 (2021-10-07)

Enhancements

- **[**feature**]** lang: add vietnamese translation [#109](https://github.com/McShelby/hugo-theme-relearn/)
- **[**feature**][**change**]** theme: simplify stylesheet for color variants [#107](https://github.com/McShelby/hugo-theme-relearn/)
- **[**feature**]** hidden pages: remove from RSS feed, JSON, taxonomy etc [#102](https://github.com/McShelby/hugo-theme-relearn/)
- **[**feature**]** theme: announce alternative content in header [#101](https://github.com/McShelby/hugo-theme-relearn/)
- **[**feature**]** menu: frontmatter option to change sort predicate [#98](https://github.com/McShelby/hugo-theme-relearn/)
- **[**feature**]** menu: add default setting for menu expansion [#97](https://github.com/McShelby/hugo-theme-relearn/)
- **[**feature**]** theme: improve print style [#93](https://github.com/McShelby/hugo-theme-relearn/issues/93)
- **[**feature**]** theme: improve style [#92](https://github.com/McShelby/hugo-theme-relearn/issues/92)

Fixes

- **[**bug**]** include: don't generate additional HTML if file should be displayed "as is" [#110](https://github.com/McShelby/hugo-theme-relearn/)
- **[**bug**]** attachments: fix broken links if multilang config is used [#105](https://github.com/McShelby/hugo-theme-relearn/)
- **[**bug**]** theme: fix sticky header to remove horizontal scrollbar [#82](https://github.com/McShelby/hugo-theme-relearn/)

Maintenance

- **[**task**]** chore: update fontawesome [#94](https://github.com/McShelby/hugo-theme-relearn/issues/94)
-

2.3.2 (2021-09-20)

Fixes

- **docs:** rename history pirate translation [#91](https://github.com/McShelby/hugo-theme-relearn/)

2.3.1 (2021-09-20)

Fixes

- **docs:** rename english pirate translation to avoid crash on rendering [#90](https://github.com/)

2.3.0 (2021-09-13)

Fixes

- **theme:** fix usage of section element [#88](https://github.com/McShelby/hugo-theme-relearn/issu

Maintenance

- **theme:** ensure IE11 compatibility [#89](https://github.com/McShelby/hugo-theme-relearn/issues.
- **docs:** Arrr! showcase multilang featurre [#87](https://github.com/McShelby/hugo-theme-relearn

2.2.0 (2021-09-09)

Enhancements

- **sitemap:** hide hidden pages from sitemap and SEO indexing [#85](https://github.com/McShelby

Fixes

- **theme:** fix showVisitedLinks in case Hugo is configured to modify relative URLs [#86](https://)

Maintenance

- **task** theme: switch from data-vocabulary to schema [#84](https://github.com/McShelby/hugo-theme-relearn)

2.1.0 (2021-09-07)

Enhancements

- **feature** search: open expand if it contains search term [#80](https://github.com/McShelby/hugo-theme-relearn)
- **feature** menu: scroll active item into view [#79](https://github.com/McShelby/hugo-theme-relearn/issues/79)
- **feature** search: disable search in hidden pages [#76](https://github.com/McShelby/hugo-theme-relearn/issues/76)
- **feature** search: improve readability of index.json [#75](https://github.com/McShelby/hugo-theme-relearn/issues/75)
- **feature** search: increase performance [#74](https://github.com/McShelby/hugo-theme-relearn/issues/74)
- **feature** search: improve search context preview [#73](https://github.com/McShelby/hugo-theme-relearn/issues/73)

Fixes

- **bug****change** search: hide non-site content [#81](https://github.com/McShelby/hugo-theme-relearn/issues/81)
- **bug** menu: always hide hidden sub pages [#77](https://github.com/McShelby/hugo-theme-relearn/issues/77)

2.0.0 (2021-08-28)

Enhancements

- **feature** tabs: enhance styling [#65](https://github.com/McShelby/hugo-theme-relearn/issues/65)
- **feature** theme: improve readability [#64](https://github.com/McShelby/hugo-theme-relearn/issues/64)
- **feature** menu: show hidden pages if accessed directly [#60](https://github.com/McShelby/hugo-theme-relearn/issues/60)
- **feature****change** theme: treat pages without title as hidden [#59](https://github.com/McShelby/hugo-theme-relearn/issues/59)
- **feature** search: show search results if field gains focus [#58](https://github.com/McShelby/hugo-theme-relearn/issues/58)
- **feature** theme: add partial templates for pre/post menu entries [#56](https://github.com/McShelby/hugo-theme-relearn/issues/56)
- **feature** theme: make chapter archetype more readable [#55](https://github.com/McShelby/hugo-theme-relearn/issues/55)
- **feature** children: add parameter for container style [#53](https://github.com/McShelby/hugo-theme-relearn/issues/53)
- **feature** theme: make content a template [#50](https://github.com/McShelby/hugo-theme-relearn/issues/50)

- **feature** menu: control menu expansion with alwaysopen parameter [#49](https://github.com/McShelby/)
- **feature** include: new shortcode to include other files [#43](https://github.com/McShelby/hugo-theme-relearn/)
- **feature** theme: adjust print styles [#35](https://github.com/McShelby/hugo-theme-relearn/issues/35)
- **feature****change** code highlighter: switch to standard hugo highlighter [#32](https://github.com/McShelby/hugo-theme-relearn/issues/32)

Fixes

- **bug****change** arrow-nav: default sorting ignores ordersectionsby [#63](https://github.com/McShelby/hugo-theme-relearn/issues/63)
- **bug****change** children: default sorting ignores ordersectionsby [#62](https://github.com/McShelby/hugo-theme-relearn/issues/62)
- **bug****change** arrow-nav: fix broken links on (and below) hidden pages [#61](https://github.com/McShelby/hugo-theme-relearn/issues/61)
- **bug** theme: remove superfluous singular taxonomy from taxonomy title [#46](https://github.com/McShelby/hugo-theme-relearn/issues/46)
- **bug****change** theme: missing --MENU-HOME-LINK-HOVER-color in documentation [#45](https://github.com/McShelby/hugo-theme-relearn/issues/45)
- **bug** theme: fix home link when base URL has some path [#44](https://github.com/McShelby/hugo-theme-relearn/issues/44)

Maintenance

- **task** docs: include changelog in exampleSite [#33](https://github.com/McShelby/hugo-theme-relearn/issues/33)

1.2.0 (2021-07-26)

Enhancements

- **feature** theme: adjust copy-to-clipboard [#29](https://github.com/McShelby/hugo-theme-relearn/issues/29)
- **feature** attachments: adjust style between notice boxes and attachments [#28](https://github.com/McShelby/hugo-theme-relearn/issues/28)
- **feature** theme: adjust blockquote contrast [#27](https://github.com/McShelby/hugo-theme-relearn/issues/27)
- **feature** expand: add option to open on page load [#25](https://github.com/McShelby/hugo-theme-relearn/issues/25)
- **feature** expand: rework styling [#24](https://github.com/McShelby/hugo-theme-relearn/issues/24)
- **feature** attachments: sort output [#23](https://github.com/McShelby/hugo-theme-relearn/issues/23)
- **feature** notice: make restyling of notice boxes more robust [#20](https://github.com/McShelby/hugo-theme-relearn/issues/20)
- **feature** notice: fix contrast issues [#19](https://github.com/McShelby/hugo-theme-relearn/issues/19)
- **feature** notice: align box colors to common standards [#18](https://github.com/McShelby/hugo-theme-relearn/issues/18)
- **feature** notice: use distinct icons for notice box type [#17](https://github.com/McShelby/hugo-theme-relearn/issues/17)

Fixes

- **[**bug**]** attachments: support i18n for attachment size [#21](https://github.com/McShelby/hugo-theme-relearn/issues/21)
- **[**bug**]** notice: support i18n for box labels [#16](https://github.com/McShelby/hugo-theme-relearn/issues/16)
- **[**bug**]** notice: support multiple blocks in one box [#15](https://github.com/McShelby/hugo-theme-relearn/issues/15)

Maintenance

- **[**task**]** dependency: upgrade jquery to 3.6.0 [#30](https://github.com/McShelby/hugo-theme-relearn/issues/30)

1.1.1 (2021-07-04)

Maintenance

- **[**task**]** theme: prepare for new hugo theme registration [#13](https://github.com/McShelby/hugo-theme-relearn/issues/13)

1.1.0 (2021-07-02)

Enhancements

- **[**feature**]** mermaid: expose options in config.toml [#4](https://github.com/McShelby/hugo-theme-relearn/issues/4)

Fixes

- **[**bug**]** mermaid: config option for CDN url not used [#12](https://github.com/McShelby/hugo-theme-relearn/issues/12)
- **[**bug**]** mermaid: only highlight text in HTML elements [#10](https://github.com/McShelby/hugo-theme-relearn/issues/10)
- **[**bug**]** mermaid: support pan & zoom for graphs [#9](https://github.com/McShelby/hugo-theme-relearn/issues/9)
- **[**bug**]** mermaid: code fences not always rendered [#6](https://github.com/McShelby/hugo-theme-relearn/issues/6)
- **[**bug**]** mermaid: search term on load may bomb chart [#5](https://github.com/McShelby/hugo-theme-relearn/issues/5)

Maintenance

- **[**task**]** mermaid: update to 8.10.2 [#7](https://github.com/McShelby/hugo-theme-relearn/issues/7)

1.0.1 (2021-07-01)

Maintenance

- **[**task**]** Prepare for hugo showcase [#3](https://github.com/McShelby/hugo-theme-relearn/issues/3)

1.0.0 (2021-07-01)

Maintenance

- **[**task**]** Fork project [#1](https://github.com/McShelby/hugo-theme-relearn/issues/1)

Resumo: # Hugo Relearn Theme A theme for [Hugo](https://gohugo.io/) designed for documentation. [★ What's new in the latest release ★](https://mcshelby.github.io/hugo-theme-relearn/basics/migration) ![Image of the Relearn theme in light and dark mode on phone, tablet and desktop](https://github.com/McShelby/hugo-theme-relearn/blob/master/assets/images/preview.png)

Hugo Relearn Theme

A theme for [Hugo](https://gohugo.io/) designed for documentation.

[★ What's new in the latest release ★](https://mcshelby.github.io/hugo-theme-relearn/basics/migration)

![Image of the Relearn theme in light and dark mode on phone, tablet and desktop](https://github.com/McShelby/hugo-theme-relearn/blob/master/assets/images/preview.png)

Motivation

The Relearn theme is a fork of the great [Learn theme](https://github.com/matcornic/hugo-theme-learn) with

Features

- **Wide set of usage scenarios**
 - Responsive design for mobile usage
 - Looks nice on paper (if it has to)
 - Usable offline, no external dependencies
 - [Usable from your local file system via `file://` protocol](https://mcshelby.github.io/hugo-theme-relearn/basics/usage#local-file-system)
 - Support for the [VSCode Front Matter extension](https://github.com/estruf/vscode-front-matter) for on
 - [Support for Open Graph, Schema and Twitter Cards](https://mcshelby.github.io/hugo-theme-relearn/basics/branding#social-media)
- **Configurable theming and visuals**
 - [Configurable brand images](https://mcshelby.github.io/hugo-theme-relearn/basics/branding#change-the-brand)
 - [Automatic switch for light/dark variant depending on your OS settings](https://mcshelby.github.io/hugo-theme-relearn/basics/branding#light-dark-mode)
 - Predefined light, dark and color variants
 - [User selectable variants](https://mcshelby.github.io/hugo-theme-relearn/basics/branding#multiple-variants)
 - [Stylesheet generator](https://mcshelby.github.io/hugo-theme-relearn/basics/generator)
 - [Configurable syntax highlighting](https://mcshelby.github.io/hugo-theme-relearn/shortcodes/highlight)
- **Unique theme features**
 - [Print whole chapters or even the complete site](https://mcshelby.github.io/hugo-theme-relearn/basics/print)
 - In page search

- [Site search](https://mcshelby.github.io/hugo-theme-relearn/basics/customization#activate-search)
 - [Dedicated search page](https://mcshelby.github.io/hugo-theme-relearn/basics/customization#activate-dedicated-search)
 - [Taxonomy support](https://mcshelby.github.io/hugo-theme-relearn/cont/taxonomy)
 - [Configurable topbar buttons](https://mcshelby.github.io/hugo-theme-relearn/basics/topbar)
 - [Unlimited nested menu items](https://mcshelby.github.io/hugo-theme-relearn/cont/pages)
 - [Configurable shortcut links](https://mcshelby.github.io/hugo-theme-relearn/cont/menushortcuts)
 - Hidden pages
 - ****Multi language support****
 - [Full support for languages written right to left](https://mcshelby.github.io/hugo-theme-relearn/cont/rtl)
 - [Available languages](https://mcshelby.github.io/hugo-theme-relearn/cont/i18n#basic-configuration): All languages supported by Hugo
 - [Search support for mixed language content](https://mcshelby.github.io/hugo-theme-relearn/cont/i18n#search)
 - ****Additional Markdown features****
 - [Support for GFM (GitHub Flavored Markdown)](https://mcshelby.github.io/hugo-theme-relearn/cont/markdown#github-flavored-markdown)
 - [Image effects like sizing, shadow, border and alignment](https://mcshelby.github.io/hugo-theme-relearn/cont/markdown#image-effects)
 - [Image lightbox](https://mcshelby.github.io/hugo-theme-relearn/cont/markdown#lightbox)
 - ****Shortcodes galore****
 - [Display resources contained in a page bundle](https://mcshelby.github.io/hugo-theme-relearn/shortcodes/bundle)
 - [Marker badges](https://mcshelby.github.io/hugo-theme-relearn/shortcodes/badge)
 - [Configurable buttons](https://mcshelby.github.io/hugo-theme-relearn/shortcodes/button)
 - [List child pages](https://mcshelby.github.io/hugo-theme-relearn/shortcodes/children)
 - [Expand areas to reveal content](https://mcshelby.github.io/hugo-theme-relearn/shortcodes/expand)
 - [Font Awesome icons](https://mcshelby.github.io/hugo-theme-relearn/shortcodes/icon)
 - [Inclusion of other files](https://mcshelby.github.io/hugo-theme-relearn/shortcodes/include)
 - [Math and chemical formulae using MathJax](https://mcshelby.github.io/hugo-theme-relearn/shortcodes/math)
 - [Mermaid diagrams for flowcharts, sequences, gantt, pie, etc.](https://mcshelby.github.io/hugo-theme-relearn/shortcodes/mermaid)
 - [Colorful boxes](https://mcshelby.github.io/hugo-theme-relearn/shortcodes/notice)
 - [OpenAPI specifications using Swagger UI](https://mcshelby.github.io/hugo-theme-relearn/shortcodes/openapi)
 - [Reveal your site's configuration parameter](https://mcshelby.github.io/hugo-theme-relearn/shortcodes/reveal)
 - [Single tabbed panels](https://mcshelby.github.io/hugo-theme-relearn/shortcodes/tab) and [multiple tabbed panels](https://mcshelby.github.io/hugo-theme-relearn/shortcodes/tabs)
- ## Installation & Usage

For a detailed description of the theme's capabilities visit the [official documentation](https://mcshelby.github.io/hugo-theme-relearn/)

```
# Relearn Theme
```

```

# These options are specific to the Relearn theme.

+++++

# Branding

# These options set your overall visual appearance.

# Used color variants.

# Default: "auto"

# This sets one or more color variants, available to your readers to choose
# from. You can
# - set a single value eg. "zen-light"
# - an array like [ "neon", "learn" ]
# - an array with options like [ { identifier = "neon" }, { identifier = "learn" } ]
# The last form allows to set further options for each variant.
# The `identifier` is mandatory. You can also set `name` which overrides the
# value displayed in the variant selector.
# If the array has more than one entry, a variant selector
# is shown in the lower part of the menu. The first entry in the array is the
# default variant, used for first time visitors.
# The theme ships with the following variants: "relearn-bright",
# "relearn-light", "relearn-dark", "zen-light", "zen-dark", "neon", "learn",
# "blue", "green", "red". In addition you can use auto mode variants. See the
# docs for a detailed explanation.

# You can also define your own variants. See the docs how this works. Also,
# the docs provide an interactive theme generator to help you with this task.

themeVariant = [
  ■{ identifier = "relearn-auto",  name = "Relearn Light/Dark", auto = [] },
  ■{ identifier = "relearn-light" },
  ■{ identifier = "relearn-dark" },
  ■{ identifier = "relearn-bright" },
  { identifier = "zen-auto",      name = "Zen Light/Dark", auto = [ "zen-light", "zen-dark" ] },
  ■{ identifier = "zen-light" },
  ■{ identifier = "zen-dark" },
  ■{ identifier = "retro-auto",   name = "Retro Learn/Neon", auto = [ "learn", "neon" ] },
  ■{ identifier = "neon" },

```

```
■{ identifier = "learn"      },
■{ identifier = "blue"      },
■{ identifier = "green"     },
■{ identifier = "red"       }
]
```

```
#++++++
```

```
# General
```

```
# These options are defining general, non visual behavior.
```

```
# Avoid new asset URLs on build.
```

```
# Default: false
```

```
# By default JavaScript-files and CSS-files get a unique ID on each rebuild.
```

```
# This makes sure, the user always has the latest version and not some stale
```

```
# copy of his browser cache. Anyways, it can be desireable to turn this
```

```
# off in certain circumstances. For example if you have Hugo's dev server
```

```
# running. Also some proxies dislike this optimization.
```

```
disableAssetsBusting = false
```

```
# Avoid generator meta tags.
```

```
# Default: false
```

```
# Set this to true if you want to disable generation for generator meta tags
```

```
# of Hugo and the theme in your HTML head. In this case also don't forget to
```

```
# set Hugo's disableHugoGeneratorInject=true. Otherwise Hugo will generate a
```

```
# meta tag into your home page anyways.
```

```
disableGeneratorVersion = false
```

```
# Avoid unique IDs.
```

```
# Default: false
```

```
# In various situations the theme generates non stable unique ids to be used
```

```
# in HTML fragment links. This can be undesirable for example when testing
```

```
# the output for changes. If you disable the random id generation, the theme
```

```
# may not function correctly anymore.
```

```
disableRandomIds = false
```

```
# Multilanguage content.
```

```
# Default: not set

# If your pages contain further languages besides the main one used, add all
# those auxiliary languages here. This will create a search index with
# support for all used languages of your site.
# This is handy for example if you are writing in Spanish but have lots of
# source code on your page which typically uses English terminology.
additionalContentLanguage = [ "en" ]

# Additional code dependencies.
# Default: See hugo.toml of the theme
# The theme provides a mechanism to load further JavaScript and CSS
# dependencies on demand only if they are needed. This comes in handy if you
# want to add own shortcodes that depend on additional code to be loaded.
# See the docs how this works.
# [relearn.dependencies]

#####

# Topbar

# These options modify the topbar appearance.
# Hide the table of contents button.

# Default: false
# If the TOC button is hidden, also the keyboard shortcut is disabled.
# This can be overridden in the page's frontmatter.

disableToc = false

# Hide the breadcrumbs.

# Default: false
# If the breadcrumbs are hidden, the title of the displayed page will still be
# shown in the topbar.

disableBreadcrumb = false

# Hide Next and Previous navigation buttons.

# Default: false
# If the navigation buttons are hidden, also the keyboard shortcuts are
# disabled.
```

```

disableNextPrev = false

# The URL prefix to edit a page.
# Default: not set
# If set, an edit button will be shown in the topbar. If the button is hidden,
# also the keyboard shortcuts are disabled. The value can contain the macro
# `${FilePath}` which will be replaced by the file path of your displayed page.
# If no `${FilePath}` is given in the value, the value is treated as if the
# `${FilePath}` was appended at the end of the value. This can be overridden
# in the pages frontmatter. This is useful if you want to give the opportunity
# for people to create merge request for your content.
editURL = "https://github.com/McShelby/hugo-theme-relearn/edit/main/exampleSite/content/${FilePath}"

+++++

# Menu
# These options modify the menu appearance.

# Hide the search box.
# Default: false
# If the search box is disabled, the search functionality is disabled too.
# This will also cause the keyboard shortcut to be disabled and the dedicated
# search page is not linked although it might be configured.
disableSearch = false

# Hide the Home entry.
# Default: false
# If shown, a Home button will appear below the search bar and the main menu.
# It links to your the home page of the current language.
disableLandingPageButton = true

# The order of main menu submenus.
# Default: "weight"
# Submenus can be ordered by "weight", "title", "linktitle", "modifieddate",
# "expirydate", "publishdate", "date", "length" or "default" (adhering to
# Hugo's default sort order). This can be overridden in the pages frontmatter.

```

```
ordersectionsby = "weight"

# The initial expand state of submenus.
# Default: not set
# This controls whether submenus will be expanded (true), or collapsed (false)
# in the menu. If not set, the first menu level is set to false, all others
# levels are set to true. This can be overridden in the page's frontmatter.
# If the displayed page has submenus, they will always been displayed expanded
# regardless of this option.

alwaysopen = ""

# Shows expander for submenus.
# Default: false
# If set to true, a submenu in the sidebar will be displayed in a collapsible
# tree view and a clickable expander is set in front of the entry.
# This can be overridden in the page's frontmatter.

collapsibleMenu = true

# Shows checkmarks for visited pages of the main menu.
# Default: false
# This also causes the display of the `Clear History` entry in the lower part
# of the menu to remove all checkmarks. The checkmarks will also been removed
# if you regenerate your site as the ids are not stable.

showVisitedLinks = true

# Hide heading above the shortcut menu.
# Default: false
# The title for the heading can be overwritten in your i18n files. See Hugo's
# documentation how to do this.

disableShortcutsTitle = false

# Hide the language switcher.
# Default: false
# If you have more than one language configured, a language switcher is
# displayed in the lower part of the menu. This option lets you explicitly
```

```

# turn this behavior off.

disableLanguageSwitchingButton = false

#####

# Hidden pages

# These options configure how hidden pages are treated.

# A page flagged as hidden, is only removed from the main menu if you are
# currently not on this page or the hidden page is not part of current page's
# ancestors. For all other functionality in Hugo a hidden page behaves like any
# other page if not otherwise configured.

# Hide hidden pages from search.

# Default: false

# Hides hidden pages from the suggestions of the search box and the dedicated
# search page.

disableSearchHiddenPages = false

# Hide hidden pages for web crawlers.

# Default: false

# Avoids hidden pages from showing up in the sitemap and on Google (et all),
# otherwise they may be indexed by search engines

disableSeoHiddenPages = true

# Hide hidden pages for taxonomies.

# Default: false

# Hides hidden pages from showing up on the taxonomy and terms pages. If this
# reduces term counters to zero, an empty but not linked term page will be
# created anyhow.

disableTagHiddenPages = false

#####

# Content

# These options modify how your content is displayed.
# Title separator.

# Default: ":::"

```

```
# Changes the title separator used when concatenating the page title with the
# site title. This is consistently used throughout the theme.
titleSeparator = "::"

# Breadcrumb separator.
# Default: ">"
# Changes the breadcrumb separator used in the topbars breadcrumb area and for
# search results and term pages.
breadcrumbSeparator = ">"

# Hide the root breadcrumb.
# Default: false
# The root breadcrumb is usually the home page of your site. Because this is
# always accessible by clicking on the logo, you may want to reduce clutter
# by removing this from your breadcrumb.
disableRootBreadcrumb = true

# Hide breadcrumbs term pages.
# Default: false
# If you have lots of taxonomy terms, the term pages may seem cluttered with
# breadcrumbs to you, so this is the option to turn off breadcrumbs on term
# pages. Only the page title will then be shown on the term pages.
disableTermBreadcrumbs = false

#####
# Highlight
# These options configure how code is displayed.

# Hide copy-to-clipboard for inline code.
# Default: false
# This removes the copy-to-clipboard button from your inline code.
disableInlineCopyToClipboard = true

# Always show copy-to-clipboard for block code.
# Default: false
```

```

# The theme only shows the copy-to-clipboard button if you hover over the code
# block. Set this to true to disable the hover effect and always show the
# button.

disableHoverBlockCopyToClipboard = false

# Wrap for code blocks.

# Default: true

# By default lines of code blocks wrap around if the line is too long to be
# displayed on screen. If you dislike this behavior, you can reconfigure it
# here.

# Note that lines always wrap in print mode regardless of this option.

# This can be overridden in the page's frontmatter or given as a parameter to
# individual code blocks.

highlightWrap = true

+++++

# Include

# These options configure how the include shortcode works.

# What to do when path is not resolved.

# Default: ""

# You can control what should happen if a path can not be resolved to as
# a resource or via the file system. If not set, no output will be written
# for the unresolved path. If set to `warning` the same happens and an additional
# warning is printed. If set to `error` an error message is printed and the build
# is aborted.

include.errorlevel = "error"

+++++

# Images

# These options configure how images are displayed.

# What to do when local image link is not resolved.

# Default: ""

# You can control what should happen if a local image can not be resolved to as

```

```
# a resource. If not set, the unresolved link is written as given into the resulting
# output. If set to `warning` the same happens and an additional warning is
# printed. If set to `error` an error message is printed and the build is
# aborted.
# Please note that this can not resolve files inside of your `static` directory.
image.errorlevel = "error"
```

```
# Image effects.
# See the documentation for how you can even add your own arbitrary effects to
# the list.
# All effects can be overridden in the page's frontmatter or through URL parameter
# given to the image. See the documentation for details.
```

```
# Default: false
imageEffects.border = true
# Default: true
imageEffects.lazy = true
# Default: true
imageEffects.lightbox = true
# Default: false
imageEffects.shadow = false
```

```
#+-----+
```

```
# Links
# These options configure how links are displayed.
```

```
# What to do when local page link is not resolved.
# Default: ""
# You can control what should happen if a local link can not be resolved to a
# page. If not set, the unresolved link is written as given into the resulting
# output. If set to `warning` the same happens and an additional warning is
# printed. If set to `error` an error message is printed and the build is
# aborted.
# Please note that with Hugo < 0.123.0 + `uglyURLs=true` this can lead to false
# negatives.
```

```
link.errorlevel = "error"
```

```
# How to open external links.
```

```
# Default: "_blank"
```

```
# For external links you can define how they are opened in your browser. All
```

```
# values for the HTML `target` attribute of the `a` element are allowed. The
```

```
# default value opens external links in a separate browser tab. If you want
```

```
# to open those links in the same tab, use "_self".
```

```
externalLinkTarget = "_self"
```

```
# Generate link URLs the Hugo way.
```

```
# Default: false
```

```
# If set to true, the theme behaves like a standard Hugo installation and
```

```
# appends no index.html to prettyURLs. As a trade off, your build project will
```

```
# not be servable from the file system.
```

```
disableExplicitIndexURLs = false
```

```
#+-----+
```

```
# MathJax
```

```
# These options configure how math formulae are displayed.
```

```
# Initialization options for MathJax.
```

```
# Default: not set
```

```
# A JSON value. See the MathJaxdocumentation for possible parameter.
```

```
# This can be overridden in the page's frontmatter.
```

```

The Relearn theme provides configuration options to change your site's colors, favicon and logo. This allows

A color variant lets you customize various visual effects of your site like almost any color, used fonts,

The Relearn theme ships with a wide set of different color variants. You can use them as-is, copy them over

Once configured in your `hugo.toml`, you can select them with the variant selector at the bottom of the menu

```
## Change the Variant (Simple) {#theme-variant}
```

```
### Single Variant
```

Set the `themeVariant` value to the name of your theme file. That's it! Your site will be displayed in the

```
{{< multiconfig file=hugo >}}
```

```
[params]
```

```
  themeVariant = "relearn-light"
```

```
{{< /multiconfig >}}
```

```
{{% notice note %}}
```

Your theme variant file must reside in your site's `assets/css` directory and the file name must start with

If you want to make changes to a shipped color variant, create a copy in your site's `assets/css` directory
{{% /notice %}}

Multiple Variants

You can also set multiple variants. In this case, the first variant is the default chosen on first view a

```
{{< multiconfig file=hugo >}}  
[params]  
  themeVariant = [ "relearn-light", "relearn-dark" ]  
{{< /multiconfig >}}
```

```
{{% notice tip %}}
```

The theme provides an advanced configuration mode, combining the functionality for multiple variants with

Although all options documented here are still working, the advanced configuration options are the recomm

```
{{% /notice %}}
```

Adjust to OS Settings

You can also cause the site to adjust to your OS settings for light/dark mode. Just set the `themeVariant

You can use the `auto` value with the single or multiple variants option. If you are using multiple varian

```
{{< multiconfig file=hugo >}}  
[params]  
  themeVariant = [ "auto", "red" ]  
{{< /multiconfig >}}
```

If you don't configure anything else, the theme will default to use `relearn-light` for light mode and `re

In the above example, you would end with `red` for light mode and the default of `relearn-dark` for dark m
If you don't like that behavior, you can explicitly set `themeVariantAuto`. The first entry in the array :

```
{{< multiconfig file=hugo >}}  
[params]  
  themeVariantAuto = [ "learn", "neon" ]  
{{< /multiconfig >}}
```

Change the Favicon

If your favicon is a SVG, PNG or ICO, just drop your image in your site's `static/images/` directory and rename it to `favicon.png`.

If you want to adjust your favicon according to your OS settings for light/dark mode, add the image files `favicon.png` and `favicon-dark.png`.

If no favicon file is found, the theme will lookup the alternative filename `logo` in the same location and use it as a fallback.

If you need to change this default behavior, create a new file `layouts/partials/favicon.html` in your site.

```
````html {title="layouts/partials/favicon.html"}
<link rel="icon" href="/images/favicon.bmp" type="image/bmp">
````
```

Change the Logo

Create a new file in `layouts/partials/logo.html` of your site. Then write any HTML you want. You could use the following as a starting point:

```
{{% notice note %}}
```

The size of the logo will adapt automatically.

```
{{% /notice %}}
```

Syntax Highlighting

If you want to switch the syntax highlighting theme together with your color variant, you need to configure the theme variant.

You can use one of the shipped stylesheet files or use Hugo to generate a file for you. The file must be named `syntax-highlighting.css`.

For an example, take a look into [`theme-relearn-light.css`](https://github.com/McShelby/hugo-theme-relearn-light/blob/master/static/css/theme-relearn-light.css).

Change the Variant (Advanced) {#theme-variant-advanced}

The theme offers a new way to configure theme variants and all of the aspects above inside of a single config file. Like with the [multiple variants](#multiple-variants) option, you are defining your theme variants in an array. Again, in this case, the first variant is the default chosen on first view and a variant selector will be added to the top of the page.

```
{< multiconfig file=hugo >}}
```

```

[params]

    themeVariant = [ "relearn-light", "relearn-dark" ]

{{< /multiconfig >}}

```

you now write it that way:

```

{{< multiconfig file=hugo >}}

```

```

[params]

    [[params.themeVariant]]

        identifier = "relearn-light"

    [[params.themeVariant]]

        identifier = "relearn-dark"

```

```

{{< /multiconfig >}}

```

The `identifier` option is mandatory and equivalent to the string in the first example. Further options c

Parameter

    [[params.themeVariant]]

        identifier = "relearn-auto"

        name = "Relearn Light/Dark"

        auto = []

    [[params.themeVariant]]

        identifier = "relearn-light"

    [[params.themeVariant]]

        identifier = "relearn-dark"

```

```

[[params.themeVariant]]
    identifier = "zen-auto"
    name = "Zen Light/Dark"
    auto = [ "zen-light", "zen-dark" ]
[[params.themeVariant]]
    identifier = "zen-light"
[[params.themeVariant]]
    identifier = "zen-dark"
[[params.themeVariant]]
    identifier = "neon"
{{< /multiconfig >}}

```

Modify Shipped Variants

In case you like a shipped variant but only want to tweak some aspects, you have two choices:

1. Copy and change

You can copy the shipped variant file from the theme's ``assets/css`` directory to the site's ``assets/css`` directory.

2. Create and import

You can create a new variant file in the site's ``assets/css`` directory and give it a new name. Import the new variant file in the theme's ``assets/css`` directory.

For example, you want to use the ``relearn-light`` variant but want to change the syntax highlighting settings.

```

` `` `css {title="assets/css/theme-my-branding.css"}
@import "theme-relearn-light.css";

:root {
    --CODE-theme: neon; /* name of the chroma stylesheet file */
    --CODE-BLOCK-color: rgba( 226, 228, 229, 1 ); /* fallback color for code text */
    --CODE-BLOCK-BG-color: rgba( 40, 42, 54, 1 ); /* fallback color for code background */
}
` `` `

```

Afterwards put this in your `hugo.toml` to use your new variant:

```
{{< multiconfig file=hugo >}}
```

```
[params]
```

```
    themeVariant = "my-branding"
```

```
{{< /multiconfig >}}
```

In comparison to `_copy and change_`, this has the advantage that you profit from any adjustments to the

Usage scenarios

The theme is usable in different scenarios, requiring the following mandatory settings in your `hugo.toml`

Public Web Server from Root

{{< multiconfig file=hugo >}}

baseUrl = "https://example.com/"

{{< /multiconfig >}}

Public Web Server from Subdirectory

{{< multiconfig file=hugo >}}

baseUrl = "https://example.com/mysite/"

relativeURLs = false

{{< /multiconfig >}}

Private Web Server (LAN)

The same settings as with any of the public web server usage scenarios or

{{< multiconfig file=hugo >}}

baseUrl = "/"

relativeURLs = true

{{< /multiconfig >}}

File System

```
{{< multiconfig file=hugo >}}
```

```
baseUrl = "/"
```

```
relativeURLs = true
```

```
{{< /multiconfig >}}
```

```
{{% notice warning %}}
```

Using a `baseUrl` with a subdirectory and `relativeURLs=true` are mutually exclusive due to the fact, that

If you need both, you have to generate your site twice but with different settings into separate directories.

```
{{% /notice %}}
```

```
{{% notice note %}}
```

Sublemental pages (like `sitemap.xml`, `rss.xml`) and generated social media links inside of your pages will

```
{{% /notice %}}
```

```
{{% notice info %}}
```

If you are using `uglyURLs=false` (Hugo's default), the theme will append an additional `index.html` to a

```
{{< multiconfig file=hugo >}}
```

```
[params]
```

```
    disableExplicitIndexURLs = true
```

```
{{< /multiconfig >}}
```

```
{{% /notice %}}
```

Activate search

If not already present, add the following lines in your `hugo.toml` file.

```
{{< multiconfig file=hugo >}}
```

```
[outputs]
```

```
    home = ["html", "rss", "search"]
```

```
{{< /multiconfig >}}
```

This will generate a search index file at the root of your public folder ready to be consumed by the Lunr

Activate dedicated search page

You can add a dedicated search page for your page by adding the `searchpage` outputformat to your home page.

```
{{< multiconfig file=hugo >}}

[outputs]

  home = ["html", "rss", "search", "searchpage"]

{{< /multiconfig >}}
```

You can access this page by either clicking on the magnifier glass or by typing some search term and pressing enter.

![Screenshot of the dedicated search page](search_page.png?&width=60pc)

{{% notice note %}}

To have Hugo create the dedicated search page successfully, you must not generate the URL `http://example.com/search`.

To make sure, there is no duplicate content for any given URL of your project, run `hugo --printPathWarnings`.

{{% /notice %}}

Activate print support

You can activate print support to add the capability to print whole chapters or even the complete site. Just add the following to your config file.

```
{{< multiconfig file=hugo >}}

[outputs]

  home = ["html", "rss", "print", "search"]

  section = ["html", "rss", "print"]

  page = ["html", "rss", "print"]

{{< /multiconfig >}}
```

This will add a little printer icon in the top bar. It will switch the page to print preview when clicked.

{{% notice note %}}

The resulting URL will not be [configured ugly](https://gohugo.io/templates/output-formats/#configure-output-formats). Nevertheless, if you're unhappy with the resulting URLs you can manually redefine `outputFormats.print` in your config file.

```
{{% /notice %}}
```

Home Button Configuration

If the `disableLandingPageButton` option is set to `false`, a Home button will appear on the left menu. It is an alternative for clicking on the logo. To edit the appearance, you will have to configure the `landingPageName` for the defined languages:

```
{{< multiconfig file=hugo >}}  
[languages]  
[languages.en]  
[languages.en.params]  
landingPageName = "<i class='fa-fw fas fa-home'></i> Home"  
[languages.pir]  
[languages.pir.params]  
landingPageName = "<i class='fa-fw fas fa-home'></i> Arrr! Homme"  
{{< /multiconfig >}}
```

If this option is not configured for a specific language, they will get their default values:

```
{{< multiconfig >}}  
landingPageName = "<i class='fa-fw fas fa-home'></i> Home"  
{{< /multiconfig >}}
```

The home button is going to look like this:

```
![Default Home Button](home_button_defaults.png?width=18.75rem)
```

Social Media Meta Tags

You can add social media meta tags for the [Open Graph](https://gohugo.io/templates/internal/#open-graph)

Change the Menu Width

The menu width adjusts automatically for different screen sizes.

| Name | Screen Width | Menu Width |
|------|---------------|------------|
| S | < 48rem | 14.375rem |
| M | 48rem - 60rem | 14.375rem |
| L | >= 60rem | 18.75rem |

The values for the screen width breakpoints aren't configurable.

If you want to adjust the menu width you can define the following CSS variables in your `custom-header.htm

```

````css
:root {
 --MENU-WIDTH-S: 14.375rem;
 --MENU-WIDTH-M: 14.375rem;
 --MENU-WIDTH-L: 18.75rem;
}
````

```

Change the Main Area's Max Width

By default the main area width will only grow to a certain extent if more vertical screen space is availa

If you are unhappy with the default, you can define the following CSS variable in your `custom-header.htm

```

````css
:root {
 --MAIN-WIDTH-MAX: 80.25rem;
}
````

```

Own Shortcodes with JavaScript Dependencies

Certain shortcodes make use of additional dependencies like JavaScript and CSS files. The theme only loads You can you use this mechanism in your own shortcodes. Say you want to add a shortcode `myshortcode` that

1. Write the shortcode file `layouts/shortcodes/myshortcode.html` and add the following line

```

````go {title="layouts/shortcodes/myshortcode.html"}

```

```

 {{- .Page.Store.Set "hasMyShortcode" true }}
....

```

1. Add the following snippet to your `hugo.toml`

```

{{< multiconfig file=hugo >}}
[params.relearn.dependencies]
 [params.relearn.dependencies.myshortcode]
 name = "MyShortcode"
{{< /multiconfig >}}

```

1. Add the dependency loader file `layouts/partials/dependencies/myshortcode.html`. The loader file will look like this:

```

* `header`: if called at the end of the HTML `head` element
* `footer`: if called at the end of the HTML `body` element

````go {title="layouts/partials/dependencies/myshortcode.html"}
{{- if eq .location "footer" }}
  <script src="https://www.unpkg.com/jquery/dist/jquery.js"></script>
{{- end }}
````

```

Character casing is relevant!

- the `name` setting in your `hugo.toml` must match the key (that needs to be prefixed with a `has`) you use in your shortcode
- the key on `params.relearn.dependencies` in your `hugo.toml` must match the base file name of your loader

See the `math`, `mermaid` and `openapi` shortcodes for examples.

```

{{% notice note %}}

```

If you are really into customization of the theme and want to use the dependency loader for your own local dependencies:

```

````go
{{- partial "dependencies.html" (dict "page" . "location" "mylocation") }}
````

```

```
{{% /notice %}}
```

## ## Output Formats

Certain parts of the theme can be changed for support of your own [output formats](https://gohugo.io/templating/)

## ## React to Variant Switches in JavaScript

Once a color variant is fully loaded, either initially or by switching the color variant manually with the theme switcher, you can react to it in JavaScript.

```
````javascript
document.addEventListener( 'themeVariantLoaded', function( e ){
    console.log( e.detail.variant ); // `relearn-light`
});
````
```

## ## Partial

The Relearn theme has been built to be as configurable as possible by defining multiple [partials](https://gohugo.io/layouts/partials/).

In ``themes/hugo-theme-relearn/layouts/partials/``, you will find all the partials defined for this theme.

This theme defines the following partials :

- ``header.html``: the header of the page. See [output-formats](#output-formats)
- ``footer.html``: the footer of the page. See [output-formats](#output-formats)
- ``body.html``: the body of the page. The body may contain one or many articles. See [output-formats](#output-formats)
- ``article.html``: the output for a single article, can contain elements around your content. See [output-formats](#output-formats)
- ``menu.html``: left menu. `_Not meant to be overwritten_`
- ``search.html``: search box. `_Not meant to be overwritten_`
- ``custom-header.html``: custom headers in page. Meant to be overwritten when adding CSS imports. Don't forget to add the CSS file in the `hugo.toml` file.
- ``custom-footer.html``: custom footer in page. Meant to be overwritten when adding JavaScript. Don't forget to add the JS file in the `hugo.toml` file.
- ``favicon.html``: the favicon
- ``heading.html``: side-wide configuration to change the pages title headings.
- ``heading-pre.html``: side-wide configuration to prepend to pages title headings. If you override this, it will be prepended to the title.

- ``heading-post.html``: side-wide configuration to append to pages title headings. If you override this, it is your responsibility
- ``logo.html``: the logo, on top left hand corner
- ``meta.html``: HTML meta tags, if you want to change default behavior
- ``menu-pre.html``: side-wide configuration to prepend to menu items. If you override this, it is your responsibility
- ``menu-post.html``: side-wide configuration to append to menu items. If you override this, it is your responsibility
- ``menu-footer.html``: footer of the left menu
- ``toc.html``: table of contents
- ``content.html``: the content page itself. This can be overridden if you want to display page's meta data
- ``content-header.html``: header above the title, has a default implementation but you can overwrite it if you want
- ``content-footer.html``: footer below the content, has a default implementation but you can overwrite it if you want

+++

This interactive tool may help you to generate your own color variant stylesheet.

{{% expand "Show usage instructions" %}}

To get started, first select a color variant from the variant selector in the lower left sidebar that fits your needs.

The graph is interactive and reflect the current colors. You can click on any of the colored boxes to adjust the color.

The arrowed lines reflect how colors are inherited through different parts of the theme if the descendant has the same color.

To better understand this select the `neon` variant and modify the different heading colors. There, colors are inherited from the parent.

Once you've changed a color, the variant selector will show a "My custom variant" entry and your changes are applied to the graph.

Once you are satisfied, you can download the new variants file and copy it into your site's `assets/css` folder.

Eg. if your new variants file is named `theme-my-custom-variant.css`, you have to set `themeVariant='my-custom-variant'` in your config file.

See the docs for [further configuration options](basics/branding)

The following steps are here to help you initialize your new website. If you don't know Hugo at all, we s

{{% notice tip %}}

The following tutorial leads you through the steps of creating a first, minimal new site.

You don't need to edit any files besides your `hugo.toml` and only need to execute the commands in the gi

{{% /notice %}}

### ## Create your Project

Hugo provides the `new` command to create a new website:

```
```shell
```

```
hugo new site my-new-site
```

```
```
```

After that change into the directory:

```
```shell
```

```
cd my-new-site
```

```
```
```

Every upcoming command will be executed from inside your new site's root.

### ## Install the Theme

### ### Downloading as Archive

You can [download the theme as .zip archive](https://github.com/McShelby/hugo-theme-relearn/archive/main.zip).

Afterwards add this at the end of your `hugo.toml`.

```
{{< multiconfig file=hugo >}}
theme = "hugo-theme-relearn"
{{< /multiconfig >}}
```

### ### Using Hugo's Module System

You can install the Relearn theme by following [the standard documentation](https://gohugo.io/hugo-modules/).

```
```shell
hugo mod init example.com
```
```

Afterwards add this at the end of your `hugo.toml`.

```
{{< multiconfig file=hugo >}}
[module]
 [[module.imports]]
 path = 'github.com/McShelby/hugo-theme-relearn'
{{< /multiconfig >}}
```

### ### Using Git Submodules

If you plan to store your project in a git repository you can create one with:

```
```shell
git init
```
```

Now add the theme as a submodule by:

```
```shell
git submodule add https://github.com/McShelby/hugo-theme-relearn.git themes/hugo-theme-relearn
```

```
````
```

Afterwards add this at the end of your `hugo.toml`.

```
{{< multiconfig file=hugo >}}
theme = "hugo-theme-relearn"
{{< /multiconfig >}}
```

## Create your Home Page

If you don't create a home page, yet, the theme will generate a placeholder text with instructions on how

Start your journey by creating a home page:

```
````shell  
hugo new --kind home _index.md  
````
```

The newly created home page `content/\_index.md` is empty and you obviously should add some meaningful content

## Create your First Chapter Page

Chapters are meant to be top level pages that contain other child pages. They have a special layout style

Now create your first chapter page with the following command:

```
````shell  
hugo new --kind chapter basics/_index.md  
````
```

When opening the newly created file `content/basics/\_index.md`, you should see the `weight` frontmatter with

## Create your First Content Pages

Then create content pages inside the previously created chapter. Here are three ways to create content in

```
````shell  
hugo new basics/first-content/_index.md
```

```
hugo new basics/second-content/index.md
```

```
hugo new basics/third-content.md
```

```
~~~~
```

Feel free to edit those files by adding some sample content and replacing the `title` value in the beginning.

```
{{% notice note %}}
```

Please note that Hugo overrides the default archetype template coming with this theme when using `hugo new`.

```
{{% /notice %}}
```

```
## Testing your Website Locally
```

Launch your new web site by using the following command:

```
~~~~shell
```

```
hugo serve
```

```
~~~~
```

Go to [`http://localhost:1313`](http://localhost:1313) in your browser.

You should notice a few things:

1. The home page contains your provided text.
2. You have the menu **Basics** in the sidebar. Clicking on it reveals three submenus with names equal to the content files.
3. While you are running `hugo serve` your page refreshes automatically when you change a content page. No need to restart the server.

```
## Build and Deploy your Website
```

When your site is ready to be deployed, run the following command:

```
~~~~shell
```

```
hugo
```

```
~~~~
```

A `public` directory will be generated, containing all content and assets for your web site.

It now can be deployed to any web server by simply uploading its contents or you can check out one of [Hugo deployment methods](https://gohugo.io/hosting/).

```
{{% notice note %}}
```

If you are storing your web site in git, commit all but the `public` directory.

```
{{% /notice %}}
```

-  New This release adds portable Markdown links

Previously it was not possible to use pure Markdown links in a configuration independent way to link to other parts of the documentation.

You could work around this by using the ``relref`` shortcode (eg ``[generator]({%/* relref "../generator" %})``).

Now it's possible to use the same path of a call to ``relref`` in a plain Markdown link (eg ``[generator]({%/* relref "../generator" %})``).

The following types of linking are supported:

| link                                             | description                                 |
|--------------------------------------------------|---------------------------------------------|
| -----                                            | -----                                       |
| <code>`[generator](en/basics/generator)`</code>  | absolute from your project root (multilang) |
| <code>`[generator](/en/basics/generator)`</code> | absolute from your project root (multilang) |
| <code>`[generator](basics/generator)`</code>     | absolute from your current language root    |
| <code>`[generator](/basics/generator)`</code>    | absolute from your current language root    |

---

## 5.22.0 (2023-10-02) 

-  Change This release fixes an issue where in unfortunate cases the documentation would not build correctly.

If you haven't modified anything, everything is fine. Otherwise you have to check your custom CSS rules to make sure they still work.

-  Change You can now have structural sections in the hierarchy of the documentation.

This can come in handy, if content for such a section page doesn't make much sense to you. See [the documentation] for more details.

This feature may require you to make changes to your existing installation if you are already using `_structured``.

In this case it is advised to remove the ``title`` from the headless branch parent's frontmatter, as it will be overwritten by the new feature.

-  New It is now possible to overwrite the default title of a page.

- `{{% badge style="info" icon="plus-circle" title=" " %}}New{{% /badge %}}` If a Mermaid graph is zoomable
- `{{% badge style="info" icon="plus-circle" title=" " %}}New{{% /badge %}}` It is now possible to remove t

---

## 2.9.0 (2021-11-19) {#290}

- {{% badge style="warning" title=" " %}}Breaking{{% /badge %}} This release removes the themes implementation

In a standard compliant form you must not link to the `\*.md` file but to its logical name. You'll see, that

| Type          | Non-Standard                     | Standard               |
|---------------|----------------------------------|------------------------|
| Branch bundle | `basics/configuration/_index.md` | `basics/configuration` |
| Leaf bundle   | `basics/configuration/index.md`  | `basics/configuration` |
| Page          | `basics/configuration.md`        | `basics/configuration` |

If you've linked from a page of one language to a page of another language, conversion is a bit more difficult

Also, the old themes implementation allowed refs to non-existing content. This will cause Hugo's implementation

In the best case your usage of the old implementation is already standard compliant and you don't need to change

You may see errors on the console after the update in the form:  
````shell

ERROR 2021/11/19 22:29:10 [en] REF_NOT_FOUND: Ref "basics/configuration/_index.md": "hugo-theme-relearn"

~~~~

In this case, you must apply one of two options:

1. Start up a text editor with regular expression support for search and replace. Search for ``(ref\s+"[`
2. Copy the old implementation files ``theme/hugo-theme-relearn/layouts/shortcode/ref.html`` and ``theme/h`

The theme comes with a reasonably configured topbar.

![Topbar on mobile devices](topbar-closed.png)

Nevertheless, your requirements may differ from this configuration. Luckily the theme got you covered as

{{% notice tip %}}

All mentioned file names below can be clicked and show you the implementation for a better understanding.

{{% /notice %}}

### ## Areas

The default configuration comes with three predefined areas that may contain an arbitrary set of buttons.

![Topbar with default areas marked](topbar-areas.png)

- **[\*\*start\*\*]**(<https://github.com/McShelby/hugo-theme-relearn/blob/main/layouts/partials/topbar/area/start>)
- **[\*\*end\*\*]**(<https://github.com/McShelby/hugo-theme-relearn/blob/main/layouts/partials/topbar/area/end.html>)
- **[\*\*more\*\*]**(<https://github.com/McShelby/hugo-theme-relearn/blob/main/layouts/partials/topbar/area/more.html>)

While you can not add additional areas in the topbar, you are free to configure additional buttons that b

### ## Buttons

The theme ships with the following predefined buttons (from left to right in the screenshot)

- {{% button style="transparent" icon="bars" %}}{{% /button %}} **[\*\*sidebar\*\*]**(<https://github.com/McShelby/hugo-theme-relearn/blob/main/layouts/partials/topbar/area/start>)
- {{% button style="transparent" icon="list-alt" %}}{{% /button %}} **[\*\*toc\*\*]**(<https://github.com/McShelby/hugo-theme-relearn/blob/main/layouts/partials/topbar/area/start>)

- `{{% button style="transparent" icon="pen" %}}{{% /button %}} [**edit**](https://github.com/McShelby/hugo-theme-stack)`
- `{{% button style="transparent" icon="print" %}}{{% /button %}} [**print**](https://github.com/McShelby/hugo-theme-stack)`
- `{{% button style="transparent" icon="chevron-left" %}}{{% /button %}} [**prev**](https://github.com/McShelby/hugo-theme-stack)`
- `{{% button style="transparent" icon="chevron-right" %}}{{% /button %}} [**next**](https://github.com/McShelby/hugo-theme-stack)`
- `{{% button style="transparent" icon="ellipsis-v" %}}{{% /button %}} [**more**](https://github.com/McShelby/hugo-theme-stack)`

Not all buttons are displayed at every given time. This is configurable (see below if interested).

## ## Redefining Areas

Each predefined area and button comes in their own file. By that it is easy for you to overwrite an area.

Eg. you can redefine the predefined `_end_` area by adding the file `[`layouts/partials/topbar/area/end.html`]`

The below example sets an explicit value for the ``onempty`` parameter, overriding the specific default value.

```
````go
{{ partial "topbar/button/more.html" (dict
    "page" .
    "onempty" "disable"
)}}
````
```

## ## Defining own Buttons

### ### Button Types

The theme distinguishes between two types of buttons:

- `[**button**](#button)`: a clickable button that either browses to another site, triggers a user defined action or opens a modal.
- `[**area-button**](#area-button)`: the template for the `{{% button style="transparent" icon="ellipsis-v" %}}` button.

### ### Button Parameter

#### #### Screen Widths and Actions

Depending on the screen width you can configure how the button should behave. Screen width is divided into three categories:

- `**s**`: (controlled by the ``onwidths`` parameter) mobile layout where the menu sidebar is hidden

- `**m**`: (controlled by the ``onwidthm`` parameter) desktop layout with visible sidebar while the content area is small
- `**l**`: (controlled by the ``onwidthl`` parameter) desktop layout with visible sidebar once the content area is large

For each width class, you can configure one of the following actions:

- ``show``: the button is displayed in its given area
- ``hide``: the button is removed
- ``area-XXX``: the button is moved from its given area into the area ``XXX``; eg. this is used to move buttons from the sidebar to the main content area

#### Hiding and Disabling Stuff

While hiding a button depending on the screen size can be configured with the above described `_hide_` action, there are other conditions for hiding buttons.

For example, the `_print_` button in its default configuration should only be displayed if print support was detected.

Another preferred condition for hiding a button is, if the displayed overlay is empty. This is the case for buttons like `_print_` or `_help_`.

This parameter can have one of the following values:

- ``disable``: the button displayed in disabled state if the overlay is empty
- ``hide``: the button is removed if the overlay is empty

If you want to disable a button containing `_no overlay_`, this can be achieved by an empty ``href`` parameter.

## Reference

### Button

Contains the basic button functionality and is used as a base implementation for all other buttons (`[`lay`

Call this from your own button templates if you want to implement a button without an overlay like the `_p`

For displaying an area in the button's overlay, see `[Area-Button](#area-button)`.

#### Parameter

| Name  | Default | Notes |

**### Predefined Buttons**

The predefined buttons by the theme (all other buttons besides the `_more_` and `_toc_` button in [`layouts/p`

Call these from your own redefined area templates if you want to use default button behavior.

The `<varying>` parameter values are different for each button and configured for standard behavior as seen below.

#### Parameter

| Name                      | Default                                | Notes                                                         |
|---------------------------|----------------------------------------|---------------------------------------------------------------|
| -----                     | -----                                  | -----                                                         |
| <code>**page**</code>     | <code>_&amp;lt;empty&amp;gt;_</code>   | Mandatory reference to the page.                              |
| <code>**onwidths**</code> | <code>_&amp;lt;varying&amp;gt;_</code> | The action, that should be executed if the site is displayed. |
| <code>**onwidthm**</code> | <code>_&amp;lt;varying&amp;gt;_</code> | See above.                                                    |
| <code>**onwidthl**</code> | <code>_&amp;lt;varying&amp;gt;_</code> | See above.                                                    |

### Predefined Overlay-Buttons

The predefined buttons by the theme that open an overlay (the `_more_` and `_toc_` button in `[`layouts/partial`

Call these from your own redefined area templates if you want to use default button behavior utilizing overlay buttons.

The `<varying>` parameter values are different for each button and configured for standard behavior as seen below.

#### Parameter

| Name                      | Default                                | Notes                                                                |
|---------------------------|----------------------------------------|----------------------------------------------------------------------|
| -----                     | -----                                  | -----                                                                |
| <code>**page**</code>     | <code>_&amp;lt;empty&amp;gt;_</code>   | Mandatory reference to the page.                                     |
| <code>**onempty**</code>  | <code>`disable`</code>                 | Defines what to do with the button if the content overlay is closed. |
| <code>**onwidths**</code> | <code>_&amp;lt;varying&amp;gt;_</code> | The action, that should be executed if the site is displayed.        |
| <code>**onwidthm**</code> | <code>_&amp;lt;varying&amp;gt;_</code> | See above.                                                           |
| <code>**onwidthl**</code> | <code>_&amp;lt;varying&amp;gt;_</code> | See above.                                                           |

Using the command: `hugo new [relative new content path]`, you can start a content file with the date and

The Relearn theme defines some few archetypes of pages but you are free to define new ones to your liking

## Predefined Archetypes

### Home {#archetypes-home}

A **Home** page is the starting page of your project. It's best to have only one page of this kind in your

![Home page](pages-home.png?width=60pc)

To create a home page, run the following command

```
````shell
```

```
hugo new --kind home _index.md
```

```
````
```

This leads to a file with the following content

```
````toml {title="_index.md"}
```

+++

archetype = "home"

title = "{{ replace .Name "-" " " | title }}"

+++

Lorem Ipsum.

~~~~

Chapter {#archetypes-chapter}

A **Chapter** displays a page meant to be used as introduction for a set of child pages. Commonly, it contains

![Chapter page](pages-chapter.png?width=60pc)

To create a chapter page, run the following command

```
```shell
```

```
hugo new --kind chapter <name>/_index.md
```

```
```
```

This leads to a file with the following content

```
```toml {title="_index.md"}
```

```
+++
```

```
archetype = "chapter"
```

```
title = "{{ replace .Name "-" " " | title }}"
```

```
weight = 1
```

```
+++
```

Lorem Ipsum.

~~~~

The `weight` number will be used to generate the subtitle of the chapter page, set the number to a consecutive

### Default {#archetypes-default}

A **Default** page is any other content page. If you set an unknown archetype in your frontmatter, this archetype

![Default page](pages-default.png?width=60pc)

To create a default page, run either one of the following commands

```
````shell
hugo new <chapter>/<name>/_index.md
````
```

or

```
````shell
hugo new <chapter>/<name>.md
````
```

This leads to a file with the following content

```
````toml {title="*.md"}
+++
title = "{{ replace .Name "-" " " | title }}"
+++

Lorem Ipsum.
````
```

## Self defined Archetypes

If you are in need of further archetypes you can define your own or even redefine existing ones.

### Template

Define a template file in your project at `archetypes/<kind>.md` and make sure it has at least the frontmatter

```
````toml {title="&lt;kind&gt;.md"}
+++
archetype = "<kind>"
+++
````
```

Afterwards you can generate new content files of that kind with the following command

```
````shell
hugo new --kind <kind> <name>/_index.md
```

....

Partial

To define how your archetypes are rendered, define corresponding partial files in your projects directory

If you use an unknown archetype in your frontmatter, the `default` archetype will be used to generate the

Related to each archetype, several `_hook_` partial files in the form of `<hook>.html` can be given inside

The following hooks are used:

| Name | Notes |
|------------|---|
| styleclass | Defines a set of CSS classes to be added to the HTML's <code><main></code> element. You can |
| article | Defines the HTML how to render your content |

Take a look at the existing archetypes of this theme to get an idea how to utilize it.

Output formats

Each hook file can be overridden of a specific [output format](https://gohugo.io/templates/output-formats)

+++

title = "Frontmatter"

weight = 2

+++

Each Hugo page **has to define** a [frontmatter](https://gohugo.io/content/front-matter/).

All Frontmatter Options

The values reflect example options. The defaults can be taken from the [annotated example](#annotated-frontmatter-options).

```
{{< multiconfig fm=true >}}
```

```
{{% include "frontmatter.toml" %}}
```

```
{{< /multiconfig >}}
```

Annotated Frontmatter Options

```
````toml {title="toml"}
```

+++

```
{{% include "frontmatter.toml" %}}+++
```

```
````
```

Some Detailed Examples

Add Icon to a Menu Entry

In the page frontmatter, add a ``menuPre`` param to insert any HTML code before the menu label. The example

```
{{< multiconfig fm=true >}}
```

```
title = "GitHub repo"
```

```
menuPre = "<i class='fab fa-github'></i> "
```

```
{{< /multiconfig >}}
```

```
![Title with icon](frontmatter-icon.png?width=18.75rem)
```

Ordering Sibling Menu/Page Entries

Hugo provides a [flexible way](https://gohugo.io/content/ordering/) to handle order for your pages.

The simplest way is to set `weight` parameter to a number.

```
{{< multiconfig fm=true >}}
```

```
title = "My page"
```

```
weight = 5
```

```
{{< /multiconfig >}}
```

Using a Custom Title for Menu Entries

By default, the Relearn theme will use a page's `title` attribute for the menu item.

But a page's title has to be descriptive on its own while the menu is a hierarchy. Hugo adds the `linkTitle`

For example (for a page named `content/install/linux.md`):

```
{{< multiconfig fm=true >}}
```

```
title = "Install on Linux"
```

```
linkTitle = "Linux"
```

```
{{< /multiconfig >}}
```

Override Expand State Rules for Menu Entries

You can change how the theme expands menu entries on the side of the content with the `alwaysopen` setting

The theme generates the menu based on the following rules:

- all parent entries of the active page including their siblings are shown regardless of any settings

- immediate children entries of the active page are shown regardless of any settings
- if not overridden, all other first level entries behave like they would have been given ``alwaysopen=false``
- if not overridden, all other entries of levels besides the first behave like they would have been given ``alwaysopen=false``
- all visible entries show their immediate children entries if ``alwaysopen=true``; this proceeds recursively
- all remaining entries are not shown

You can see this feature in action on the example page for `[children shortcode](shortcodes/children)` and `[children shortcode](shortcodes/children)`.

Disable Section Pages

You may want to structure your pages in a hierarchical way but don't want to generate pages for those sections.

To stay with the initial example: Suppose you want ``level-one`` appear in the sidebar but don't want to generate pages for those sections.

For this, open ``content/level-one/_index.md`` and add the following frontmatter

```
{{< multiconfig fm=true >}}
collapsibleMenu = true
[_build]
  render = "never"
{{< /multiconfig >}}
```

If an option value is said to be not set, you can achieve the same behavior
by giving it an empty string value.

#####

Hugo

These options usually apply to other themes as well.

The social media image of your page.

Default: not set

This is used for generating social media meta information for the opengraph
protocol and twitter cards.

If not set, the set value of your site's hugo.toml is used.

images = ["images/hero.png"]

The title of your page.

Default: not set

A page without a title is treated as a hidden page.

title = "Example Page"

The description of your page.

Default: not set

This is used for generating HTML meta tags, social media meta information
for the opengraph protocol and twitter cards.

If not set, the set value of your site's hugo.toml is used for the html

meta tag, social media meta information for the opengraph protocol and
twitter cards.

description = ""

#####

Relearn Theme

```
# These options are specific to the Relearn theme.

#####

# Topbar

# These options modify the topbar appearance.

# Hide the table of contents button.

# Default: false

# If the TOC button is hidden, also the keyboard shortcut is disabled.

# If not set, the set value of your site's hugo.toml is used.

disableToc = false

# Hide the breadcrumbs.

# Default: false

# If the breadcrumbs are hidden, the title of the displayed page will still be

# shown in the topbar.

disableBreadcrumb = false

# Hide Next and Previous navigation buttons.

# Default: false

# If the navigation buttons are hidden, also the keyboard shortcuts are

# disabled.

disableNextPrev = false

# The URL prefix to edit a page.

# Default: not set

# If set, an edit button will be shown in the topbar. If the button is hidden,

# also the keyboard shortcuts are disabled. The value can contain the macro

# `${FilePath}` which will be replaced by the file path of your displayed page.

# If not set, the set value of your site's hugo.toml is used. If the global

# parameter is given but you want to hide the button for the displayed page,

# you can set the value to an empty string. If instead of hiding you want to have

# an disabled button, you can set the value to a string containing just spaces.

# This is useful if you want to give the opportunity for people to create merge

# request for your content.
```

```

```
## Search
```

In case each page's content is written in one single language only, the above configuration will already work

```
{{% notice warning %}}
```

Although the theme supports a wide variety of supported languages, the site's search via the `[Lunr](https://lunrjs.com/)` You'll see error reports in your browsers console log for each unsupported language. Currently unsupported

- Czech

- Indonesian
- Polish
- Swahili

```
{{% /notice %}}
```

```
### Search with mixed language support
```

In case your page's content contains text in multiple languages (e.g. you are writing a Russian documenta

```
{{< multiconfig file=hugo >}}
```

```
[params]
```

```
    additionalContentLanguage = [ "en" ]
```

```
{{< /multiconfig >}}
```

As this is an array, you can add multiple additional languages.

```
{{% notice note %}}
```

Keep in mind that the language code required here, is the base language code. E.g. if you have additional

```
{{% /notice %}}
```

```
## Overwrite translation strings
```

Translations strings are used for common default values used in the theme (_Edit_ button, _Search placeho

To override these values, create a new file in your local i18n folder `i18n/<idlanguage>.toml` and inspire

```
## Disable language switching
```

Switching the language in the browser is a great feature, but for some reasons you may want to disable it

Just set `disableLanguageSwitchingButton=true` in your `hugo.toml`

```
{{< multiconfig file=hugo >}}
```

```
[params]
```

```
    disableLanguageSwitchingButton = true
```

```
{{< /multiconfig >}}
```

+++

title = "Image Effects"

weight = 5

+++

The theme supports non-standard [image effects](cont/markdown#image-effects).

| Name | Description | |
|----------|---|--|
| ----- | ----- | |
| border | Draws a light thin border around the image | |
| lazy | Lets the image be lazy loaded | |
| lightbox | The image will be clickable to show it enlarged | |
| shadow | Draws a shadow around the image to make it appear hovered/glowing | |

As [described](cont/markdown#image-effects), you can add this to the URL query parameter, but this may be

Instead, you can configure the defaults in your `hugo.toml` as well as overriding these default in the page

Explicitly set URL query parameter will override the defaults in effect for a page.

Without any settings in your `hugo.toml` this defaults to

```
{{< multiconfig file=hugo >}}
```

```
[params]
```

```
  [params.imageEffects]
```

```
    border = false
```

```
    lazy = true
```

```
    lightbox = true
```

```
    shadow = false
```

```
{{< /multiconfig >}}
```

This can be overridden in a pages frontmatter by eg.

```
{{< multiconfig fm=true >}}  
[imageEffects]  
    border = true  
{{< /multiconfig >}}
```

Or by explicitly override settings by URL query parameter

```
````md {title="URL"}  
![Minion](https://octodex.github.com/images/minion.png?lightbox=false&bg-white=true)
````
```

The settings applied to the above image would be

```
{{< multiconfig >}}  
border = true  
lazy = true  
lightbox = false  
shadow = false  
bg-white = true  
{{< /multiconfig >}}
```

This ends up in the following HTML where the parameter are converted to CSS classes.

```
````html {title="HTML"}  

````  
## Extending
```

As you can see in the above example, the `bg-white` parameter is not initially supported in the themes default

```
{{% notice note %}}
```

If no extended parameter like `bg-white` in the example is set on the URL, a `class="nobg-white"` in the HTML

```

+++

Let's face it: Writing content for the web is tiresome. WYSIWYG editors help alleviate this task, but they

Markdown is a better way to write **HTML**, without all the complexities and ugliness that usually accom

Some of the key benefits are:

1. Markdown is simple to learn, with minimal extra characters so it's also quicker to write content.
2. Less chance of errors when writing in Markdown.
3. Produces valid HTML output.
4. Keeps the content and the visual display separate, so you cannot mess up the look of your site.
5. Write in any text editor or Markdown application you like.
6. Markdown is a joy to use!

John Gruber, the author of Markdown, puts it like this:

> The overriding design goal for Markdown's formatting syntax is to make it as readable as possible. The

## ## Lists

### ### Unordered

You can write a list of items in which the order of the items does not explicitly matter.

It is possible to nest lists by indenting an item for the next sublevel.

You may use any of ``-``, ``*`` or ``+`` to denote bullets for each list item but should not switch between those

```
````md
- Lorem ipsum dolor sit amet
- Consectetur adipiscing elit
  - Vestibulum laoreet porttitor sem
  - Ac tristique libero volutpat at
- Nulla volutpat aliquam velit
  - Phasellus iaculis neque
  - Purus sodales ultricies
- Faucibus porta lacus fringilla vel

+++

title = "Menu extra shortcuts"

weight = 6

+++

You can define additional menu entries or shortcuts in the navigation menu without any link to content.

## Basic configuration

Edit the website configuration `hugo.toml` and add a `[[menu.shortcuts]]` entry for each link your want to

Example from the current website:

```
{{< multiconfig file=hugo >}}
```

```
[[menu.shortcuts]]
```

```
name = "<i class='fa-fw fab fa-github'></i> GitHub repo"
```

```
identifier = "ds"
```

```
url = "https://github.com/McShelby/hugo-theme-relearn"
```

```
weight = 10
```

```
[[menu.shortcuts]]
```

```
name = "<i class='fa-fw fas fa-camera'></i> Showcases"
```

```
url = "showcase/"
```

```
weight = 11
```

```
[[menu.shortcuts]]
```

```
name = "<i class='fa-fw fas fa-bookmark'></i> Hugo Documentation"
```

```
identifier = "hugodoc"
```

```
url = "https://gohugo.io/"
```

```
weight = 20
```

```
[[menu.shortcuts]]
name = "<i class='fa-fw fas fa-bullhorn'></i> Credits"
url = "more/credits/"
weight = 30
```

```
[[menu.shortcuts]]
name = "<i class='fa-fw fas fa-tags'></i> Tags"
url = "tags/"
weight = 40
{{< /multiconfig >}}
```

By default, shortcuts are preceded by a title. This title can be disabled by setting `disableShortcutsTitle`. However, if you want to keep the title but change its value, it can be overridden by changing your local configuration.

For example, in your local `en.toml` file, add the following content

```
````toml {title="en.toml"}
[Shortcuts-Title]
other = "<Your value>"
````
```

Read more about `[hugo menu]` (<https://gohugo.io/extras/menus/>) and `[hugo i18n translation strings]` (<https://gohugo.io/extras/translation-strings/>)

## Configuration for Multilingual mode {#i18n}

When using a multilingual website, you can set different menus for each language. In the `hugo.toml` file,

Example from the current website:  

```
{{< multiconfig file=hugo >}}
```

```
[languages]

[languages.en]

    title = "Hugo Relearn Theme"

    weight = 1

    languageName = "English"

[languages.en.params]
```

```
landingPageName = "<i class='fa-fw fas fa-home'></i> Home"
```

```
[[languages.en.menu.shortcuts]]
```

```
name = "<i class='fa-fw fab fa-github'></i> GitHub repo"
```

```
identifier = "ds"
```

```
url = "https://github.com/McShelby/hugo-theme-relearn"
```

```
weight = 10
```

```
[[languages.en.menu.shortcuts]]
```

```
name = "<i class='fa-fw fas fa-camera'></i> Showcases"
```

```
pageRef = "showcase/"
```

```
weight = 11
```

```
[[languages.en.menu.shortcuts]]
```

```
name = "<i class='fa-fw fas fa-bookmark'></i> Hugo Documentation"
```

```
identifier = "hugodoc"
```

```
url = "https://gohugo.io/"
```

```
weight = 20
```

```
[[languages.en.menu.shortcuts]]
```

```
name = "<i class='fa-fw fas fa-bullhorn'></i> Credits"
```

```
pageRef = "more/credits/"
```

```
weight = 30
```

```
[[languages.en.menu.shortcuts]]
```

```
name = "<i class='fa-fw fas fa-tags'></i> Tags"
```

```
pageRef = "tags/"
```

```
weight = 40
```

```
[languages.pir]
```

```
title = "Cap'n Hugo Relearrn Theme"
```

```
weight = 1
```

```
languageName = "Arrr! Pirrrates"
```

```
[languages.pir.params]
```

```
landingPageName = "<i class='fa-fw fas fa-home'></i> Arrr! Home"
```

```

[[languages.pir.menu.shortcuts]]
    name = "<i class='fa-fw fab fa-github'></i> GitHub repo"
    identifier = "ds"
    url = "https://github.com/McShelby/hugo-theme-relearn"
    weight = 10

[[languages.pir.menu.shortcuts]]
    name = "<i class='fa-fw fas fa-camera'></i> Showcases"
    pageRef = "showcase/"
    weight = 11

[[languages.pir.menu.shortcuts]]
    name = "<i class='fa-fw fas fa-bookmark'></i> Cap'n Hugo Documentat'n"
    identifier = "hugodoc"
    url = "https://gohugo.io/"
    weight = 20
[[languages.pir.menu.shortcuts]]
    name = "<i class='fa-fw fas fa-bullhorn'></i> Crrredits"
    pageRef = "more/credits/"
    weight = 30

[[languages.pir.menu.shortcuts]]
    name = "<i class='fa-fw fas fa-tags'></i> Arrr! Tags"
    pageRef = "tags/"
    weight = 40
{{< /multiconfig >}}

```

## Shortcuts to pages inside of your project

If you have shortcuts to pages inside of your project and you don't want them to show up in page menu section, you can use the following configuration:

1. Make the page file for the shortcut a [headless branch bundle](https://gohugo.io/content-management/page-bundles/#headless-branch-bundle)
 

```

{{< multiconfig fm=true >}}
title = "Showcase"

```

```
[_build]
  render = "always"
  list = "never"
  publishResources = true
{{< /multiconfig >}}
```

2. Store the page file for the shortcut below a parent headless branch bundle and add the following front

```
{{< multiconfig fm=true >}}
[_build]
  render = "never"
  list = "never"
  publishResources = false
{{< /multiconfig >}}
```

In this case, the file itself can be a branch bundle, leaf bundle or simple page (see exampleSite's `C

```
{{< multiconfig fm=true >}}
title = "Credits"
{{< /multiconfig >}}
```

+++

```
categories = ["taxonomy", "content"]
```

```
tags = "tutorial"
```

```
title = "Taxonomy"
```

```
weight = 8
```

+++

The Relearn theme supports Hugo's default taxonomies `_tag_` and `_category_` out of the box.

### ## Configuration

Just add tags and/or categories to any page. They can be given as a single string or an array of strings.

```
{{< multiconfig fm=true >}}
```

```
categories = ["taxonomy", "content"]
```

```
tags = "tutorial"
```

```
title = "Taxonomy"
```

```
{{< /multiconfig >}}
```

### ## Behavior

The tags are displayed at the top of the page in alphabetical order.

The categories are displayed at the bottom of the page in alphabetical order in the default implementation.

Each item is a link to a taxonomy page displaying all the articles with the given term.

### ## List all the tags

In the ``hugo.toml`` file you can add a shortcut to display all the tags and categories

```
{{< multiconfig file=hugo >}}
```

```
[[menu.shortcuts]]
```

```
name = "<i class='fa-fw fas fa-tags'></i> Tags"
```

```
url = "/tags"
```

```
[[menu.shortcuts]]
```

```
name = "<i class='fa-fw fas fa-layer-group'></i> Categories"
```

```
url = "/categories"
```

```
{{< /multiconfig >}}
```

```
Customization
```

If you define [custom taxonomies](<https://gohugo.io/content-management/taxonomies/#configure-taxonomies>) a

```
````go
```

```
{{ partial "term-list.html" (dict
```

```
  "page" .
```

```
  "taxonomy" "categories"
```

```
  "icon" "layer-group"
```

```
) }}
```

```
````
```

```
Parameter
```

| Name            | Default                  | Notes                                                                                                                  |

### ## Code Quality

A new release can happen at any time from the `main` branch of the [GitHub project](https://github.com/McShelby/hugo-theme-relearn) without further acknowledgment.

Stay simple for the user by focusing on the mantra "convention over configuration".

At installation the site should work reasonable without (m)any configuration.

Stay close to the Hugo way.

Don't use npm or any preprocessing, our contributors may not be front-end developers.

Document new features in the exampleSite. This also contains entries to the [What's new](basics/migration) page.

Don't break existing features if you don't have to.

Remove reported issue from the browser's console.

Check for unnecessary whitespace and correct indentation of your resulting HTML.

### ## Conventional Commits

Write commit messages in the [conventional commit](https://www.conventionalcommits.org/en/v1.0.0/) format. Following is an incomplete list of some of the used conventional commit types. Be creative.

| Common | Feature | Structure | Shortcodes |
|--------|---------|-----------|------------|
| -----  | -----   | -----     | -----      |

|            |            |                 |             |  |

All other entries on the [What's new](basics/migration) page will increase the minor release number.

Releases resulting in a new major or minor number are called main release.

Releases containing bugfixes only, are only increasing the patch release number. Those releases don't res

Entries on the [What's new](basics/migration) page are checked and enforced during the `version-release`

## Managing Issues

Issues are categorized and managed by assigning [labels](#labels) to it.

Once working on an issue, assign it to a fitting maintainer.

When done, close the ticket. Once an issue is closed, it needs to be assigned to next release milestone.

A once released ticket is not allowed to be reopened and rereleased in a different milestone. This would

## Managing Pull Requests

If a PR is merged and closed it needs an accompanied issue assigned to. If there is no issue for a PR, the  
You can assign multiple PRs to one issue as long as they belong together.

Usually set the same labels and milestone for the PR as for the accompanied issue.

## ## Labels

### ### Kind

An issue that results in changesets must have exactly one of the following labels. This needs to be assigned

| Label         | Description                                |
|---------------|--------------------------------------------|
| documentation | Improvements or additions to documentation |
| discussion    | This issue was converted to a discussion   |
| task          | Maintenance work                           |
| feature       | New feature or request                     |
| bug           | Something isn't working                    |

### ### Impact

If the issue would cause a new main release due to [semver semantics](#semver) it needs one of the according

| Label    | Description                                             |
|----------|---------------------------------------------------------|
| change   | Introduces changes with existing installations          |
| breaking | Introduces breaking changes with existing installations |

### ### Declination

If an issue does not result in changesets but is closed anyways, it must have exactly one of the following

| Label      | Description                               |
|------------|-------------------------------------------|
| duplicate  | This issue or pull request already exists |
| invalid    | This doesn't seem right                   |
| support    | Request for achieving a special goal      |
| unresolved | No progress on this issue                 |
| update     | A change in behavior after update         |

| {{% badge color="#9fa2a5" %}}wontchange{{% /badge %}} | This will not be worked on |

### ### Halt

You can assign one further label out of the following list to signal readers that development on an open

| Label                                                    | Description                                 |
|----------------------------------------------------------|---------------------------------------------|

## ## Making Releases

A release is based on a milestone named like the release itself - just the version number, eg: `1.2.3`. I

Making releases is automated by the `version-release` GitHub Action. It requires the version number of the

Treat released milestones as immutable. Don't rerelease an already released milestone. An already released  
During execution of the action a few things are checked. If a check fails the action fails, resulting in  
The following checks will be enforced  
- the milestone exists

- there is at least one closed issue assigned to the milestone
- all assigned issues for this milestone are closed
- if it's a main release, there must be a new ``<major>.<minor>`` at the beginning of the [What's new](basics/whats-new/index.html) page
- if it's a patch release, there must be the ``<major>.<minor>`` from the previous release at the beginning

After a successful run of the action

- the [History](https://mcshelby.github.io/hugo-theme-relearn/basics/history/index.html) page is updated,
- the [What's new](https://mcshelby.github.io/hugo-theme-relearn/basics/migration/index.html) page is updated
- the version number for the ``<meta generator>`` is updated
- the updated files are committed
- the milestone is closed
- the repository is tagged with the version number (eg. `1.2.3`), the main version number (eg. `1.2.x`) and the patch version number (eg. `1.2.3-patch`)
- a new entry in the [GitHub release list](https://github.com/McShelby/hugo-theme-relearn/releases) with the version number and the patch version number
- the [official documentation](https://mcshelby.github.io/hugo-theme-relearn/index.html) is built and deployed
- the version number for the ``<meta generator>`` is updated to a temporary and committed (this helps to determine the next patch release)
- a new milestone for the next patch release is created (this can later be renamed to a main release if needed)

+++

Sometimes screenshots need to be redone. This page explains how to create the different screenshots, tools

## Common

**Creation:**

- Use English translation
- Empty search
- Remove history checkmarks but leave it on the page thats used for the screenshot
- After resize of the page into the required resolution, reload the page to have all scrollbars in default

## Demo Screenshot

**Content:**

A meaningful full-screen screenshot of an interesting page.

The content should be:

- timeless: not showing any dates or often edited content
- interesting: show a bunch of interesting elements like headings, code, etc
- balanced: no cluttering with overpresent elements or coloring
- aligned: aligned outlines

**Used by:**

- Hugo Themes info: <https://themes.gohugo.io/themes/hugo-theme-relearn/> \_1000 x 1500 @ 1\_

**Page URL:** [Screenshot Link](shortcodes/notice)

**\*\*Creation\*\*:**

- save as `images/screenshot.png`

**\*\*Remarks\*\*:**

The location is mandatory due to Hugo's theme site builder.

**\*\*Preview\*\*** `images/screenshot.png`:

![Screenshot](/images/screenshot.png?width=50%25&height=50%25)

## Hero Image

**\*\*Content\*\*:**

Show the [Demo Screenshot](#demo-screenshot) page on different devices and different themes. Composition

The content should be:

- consistent: always use the same page for all devices
- pleasing: use a delightful background

**\*\*Used by\*\*:**

- Hugo Themes gallery: <https://themes.gohugo.io/tags/docs/> \_900 x 600\_
- Hugo Themes notes: <https://themes.gohugo.io/themes/hugo-theme-relearn/> \_1280 x 640\_
- GitHub project site: <https://github.com/McShelby/hugo-theme-relearn> \_1280 x 640\_
- GitHub social media preview: <https://github.com/McShelby/hugo-theme-relearn/settings> \_1280 x 640\_

**\*\*Page URL\*\*:** [Hero Image Link](shortcodes/notice)

**\*\*Creation\*\*:**

- Template: <http://www.pixeden.com/psd-web-elements/psd-screen-web-showcase>
- Desktop: light theme \_1440 x 900 @ 1\_

- Tablet: light theme \_778 x 1038 @ 1\_
- Phone: dark theme \_450 x 801 @ .666\_
- From original template size resize to \_2700 x 1800\_ centered, scale to \_900 x 600\_ and save as `images/`
- From original template size resize to \_3000 x 1500\_ offset y: \_-330\_, scale to \_1280 x 640\_ and save as

**\*\*Remarks\*\*:**

The location of `images/tn.png` is mandatory due to Hugo's theme site builder.

**\*\*Preview\*\*** `images/hero.png`:

![[Hero]](/images/hero.png?width=50%25&height=50%25)

### ## Contributors

Special thanks to [everyone who has contributed](https://github.com/McShelby/hugo-theme-relearn/graphs/contributors) to this project.

Many thanks to [Mathieu Cornic](https://github.com/matcornic) for his work on porting the [Learn theme](https://github.com/matcornic/hugo-theme-relearn).

Many thanks to [Andy Miller](https://github.com/rhukster) for initially creating the [Learn theme](https://github.com/matcornic/hugo-theme-relearn).

### ## Theme Dependencies

- [autoComplete](https://github.com/Pixabay/JavaScript-autoComplete) - A lightweight and powerful vanilla JavaScript autocomplete library
- [clipboard.js](https://clipboardjs.com) - A modern approach to copy text to clipboard
- [d3-zoom](https://github.com/d3/d3-zoom) - Pan and zoom SVG, HTML or Canvas using mouse or touch input
- [d3-color](https://github.com/d3/d3-color) - Color spaces! RGB, HSL, Cubehelix, CIELAB, and more
- [d3-dispatch](https://github.com/d3/d3-dispatch) - Register named callbacks and call them with arguments
- [d3-ease](https://github.com/d3/d3-ease) - Easing functions for smooth animation
- [d3-interpolate](https://github.com/d3/d3-interpolate) - Interpolate numbers, colors, strings, arrays, objects, etc.
- [d3-selection](https://github.com/d3/d3-selection) - Transform the DOM by selecting elements and joining data
- [d3-timer](https://github.com/d3/d3-timer) - An efficient queue for managing thousands of concurrent timers
- [d3-transition](https://github.com/d3/d3-transition) - Animated transitions for D3 selections
- [d3-drag](https://github.com/d3/d3-drag) - Drag and drop SVG, HTML or Canvas using mouse or touch input
- [Font Awesome](https://fontawesome.com) - The internet's icon library and toolkit
- [JS-YAML](https://github.com/nodeca/js-yaml) - JavaScript YAML parser and dumper
- [Lunr](https://lunrjs.com) - Enables a great search experience without the need for external, server-side search engines
- [Lunr Languages](https://github.com/MihaiValentin/lunr-languages) - A collection of languages stemmers and tokenizers
- [MathJax](https://mathjax.org/) - Beautiful math and chemical formulae in all browsers

- [Mermaid](https://mermaid-js.github.io/mermaid) - Generation of diagram and flowchart from text in a simple language
- [Perfect Scrollbar](https://perfectscrollbar.com) - A minimalistic but perfect custom scrollbar plugin
- [SwaggerUI](https://github.com/swagger-api/swagger-ui) - Generate beautiful documentation from a Swagger definition
- [WorkSans](https://weiweihuanghuang.github.io/Work-Sans/) - Work Sans is a 9 weight typeface family based on the classic Helvetica

## ## Docs Dependencies

{{% notice warning %}}

This shortcode is deprecated in favor of the new [`resources`` shortcode](shortcodes/resources). See [migration instructions](#migration) below.

The examples on this page were removed.

{{% /notice %}}

The ``attachments`` shortcode displays a list of files attached to a page with adjustable color, title and description.

### ## Migration

While this shortcode will still be available for some time, it does not receive support anymore. Start to migrate your pages to the new `[resources`]` shortcode.

The [`resources`` shortcode](shortcodes/resources) leverages Hugo's resource feature for page bundles. It is the recommended way to manage attachments in Hugo.

To migrate your pages apply the following steps:

1. If a page is not already a [page bundle](https://gohugo.io/content-management/page-bundles/) convert it into a page bundle.
2. Move your files to a valid destination inside of your page bundle (depending if you have a branch or a bundle).
3. Change the calls from the ``attachments`` shortcode to the [`resources`` shortcode](shortcodes/resources).

Multilanguage features are not supported directly by the shortcode anymore but rely on Hugo's handling for multilanguage.

### ## Usage

While the examples are using shortcodes with named parameter you are free to also call this shortcode from a regular Hugo template.

```
{{< tabs groupid="shortcode-parameter">}}
{{% tab title="shortcode" %}}
```

```
````go
{{%/ attachments sort="asc" */%}}
```

```
{{% /tab %}}
{{% tab title="partial" %}}
```

```
````go
{{ partial "shortcodes/attachments.html" (dict
 "page" .
 "sort" "asc"
)}}
````
```

```
{{% /tab %}}
{{< /tabs >}}
```

Parameter

| Name | Default | Notes |
|---------|-------------|---|
| style | transparent | The style scheme used for the box.

| icon | see notes | [Font Awesome icon name](shortcodes/icon#finding-an-icon) set to the le |
| sort | asc | Sorting the output in ascending or descending order. |
| pattern | .* | A [regular expressions](https://en.wikipedia.org/wiki/Regular_expression) |

Setup

Single language

The shortcode lists files found in a specific folder. The name of the folder depends on your page type (e.g. leaf bundle).

1. If your page is a leaf bundle, attachments must be placed in a nested index.files folder, accordingly.

```

> * content
>   * _index.md
>   * page
>     * index.md
>     * **index.files**
>       * attachment.pdf

```

2. If your page is a branch bundle, attachments must be placed in a nested `\_index.files` folder, according

{{% badge style="warning" title=" " %}}Warning{{% /badge %}} This is only available for Hugo < `0.112`

```

> * content
>   * _index.md
>   * page
>     * _index.md
>     * **_index.files**
>       * attachment.pdf

```

3. For simple pages, attachments must be placed in a folder named like your page and ending with `.files`

{{% badge style="warning" title=" " %}}Warning{{% /badge %}} This is only available for Hugo < `0.112`

```

> * content
>   * _index.md
>   * **page.files**
>     * attachment.pdf
>   * page.md

```

Multilingual

Be aware that if you use a multilingual website, you will need to have as many folders as languages and th

Eg. for a site in English and Piratish:

```

> * content
>   * index.en.md

```

```
> * index.pir.md
> * page
> * index.en.md
> * index.pir.md
> * **index.en.files**
> * attachment.pdf
> * **index.pir.files**
> * attachment.pdf
```

+++

description = "Clickable buttons"

title = "Button"

+++

The `button` shortcode displays a clickable button with adjustable color, title and icon.

```
{{% button href="https://gohugo.io/" %}}Get Hugo{{% /button %}}
```

```
{{% button href="https://gohugo.io/" style="warning" icon="dragon" %}}Get Hugo{{% /button %}}
```

### ## Usage

While the examples are using shortcodes with named parameter you are free to also call this shortcode from

```
{{< tabs groupid="shortcode-parameter">}}
```

```
{{% tab title="shortcode" %}}
```

```
````go

Parameter

| Name | Default | Notes |
|-----------------------|----------------------|---|
| ----- | ----- | ----- |
| containerstyle | <code>`ul`</code> | Choose the style used to group all children. It could be any HTML element. |
| style | <code>`li`</code> | Choose the style used to display each descendant. It could be any HTML element. |
| showhidden | <code>`false`</code> | When <code>`true`</code> , child pages hidden from the menu will be displayed. |
| description | <code>`false`</code> | When <code>`true`</code> shows a short text under each page in the list. When <code>`true`</code> and <code>showhidden</code> is <code>`true`</code> , the description will be displayed for hidden pages too. |
| depth | <code>`1`</code> | The depth of descendants to display. For example, if the value is <code>`2`</code> , the first level of children will be displayed, and the first level of children of the first level of children will be displayed. |
| sort | <code>`auto`</code> | The sort criteria of the displayed list.

- <code>`auto`</code> default |

Examples

All Default

```

The `expand` shortcode displays an expandable/collapsible section of text.

{{% expand title="Expand me..." %}}Thank you!

That's some text with a footnote^[1]

^[1]: And that's the footnote.

That's some more text with a footnote.^[^someid]

^[^someid]:

Anything of interest goes here.

Blue light glows blue.

{{% /expand %}}

Usage

While the examples are using shortcodes with named parameter you are free to use positional as well or all.

{{< tabs groupid="shortcode-parameter">}}

{{% tab title="shortcode" %}}

~~~~go

{{%/ \* expand title="Expand me..." \*/%}}Thank you!{{%/ \* /expand \*/%}}

````

```
{{% /tab %}}

{{% tab title="shortcode (positional)" %}}
```

```
````go

{{%/ * expand "Expand me..." */%}}Thank you!{{%/ * /expand */%}}

````
```

```
{{% /tab %}}

{{% tab title="partial" %}}
```

```
````go

{{ partial "shortcodes/expand.html" (dict
  "page" .
  "title" "Expand me..."
  "content" "Thank you!"
)}}

````
```

```
{{% /tab %}}

{{< /tabs >}}
```

### Parameter

| Name      | Position | Default        | Notes                                                       |
|-----------|----------|----------------|-------------------------------------------------------------|
| title     | 1        | "Expand me..." | Arbitrary text to appear next to the expand/collapse button |
| open      | 2        | false          | When true the content text will be initially shown          |
| <content> |          | <empty>        | Arbitrary text to be displayed on expand.                   |

## Examples

### All Defaults

```
````go
```

```
{{%/ * expand */%}}Yes, you did it!{{%/ * /expand */%}}
```

```
....
```

```
{{% expand %}}Yes, you did it!{{% /expand %}}
```

```
### Initially Expanded
```

```
````go
```

```
{{%/ * expand title="Expand me..." open="true" */%}}No need to press you!{{%/ * /expand */%}}
```

```
....
```

```
{{% expand title="Expand me..." open="true" %}}No need to press you!{{% /expand %}}
```

```
### Arbitrary Text
```

```
````go
```

```
{{%/ * expand title="Show me almost endless possibilities" */%}}
```

You can add standard markdown syntax:

- multiple paragraphs
- bullet point lists
- emphasized, **bold** and even **bold emphasized** text
- [links](https://example.com)
- etc.

```
``plaintext
```

...and even source code

```
...
```

> the possibilities are endless (almost - including other shortcodes may or may not work)

```
{{%/ * /expand */%}}
```

```
....
```

```
{{% expand title="Show me almost endless possibilities" %}}
```

You can add standard markdown syntax:

- multiple paragraphs
- bullet point lists
- emphasized, **bold** and even **bold emphasized** text
- [links](https://example.com)
- etc.

```
```plaintext
```

```
...and even source code
```

```
```
```

> the possibilities are endless (almost - including other shortcodes may or may not work)

```
{{% /expand %}}
```

```

The `highlight` shortcode renders your code with a syntax highlighter.

```
{{< highlight lineNos="true" type="py" wrap="true" title="python" >}}

print("Hello World!")

{{< /highlight >}}
```

## Usage

This shortcode is fully compatible with Hugo's [`highlight` shortcode](<https://gohugo.io/content-management/shortcodes/#highlight>).

It is called interchangeably in the same way as Hugo's own shortcode providing positional parameter or by

You are free to also call this shortcode from your own partials. In this case it resembles Hugo's [`highlight` shortcode]

While the examples are using shortcodes with named parameter it is recommended to use codefences instead.

```

### Parameter

| Name                                 | Position | Default                  | Notes                                                                  |
|--------------------------------------|----------|--------------------------|------------------------------------------------------------------------|
| -----                                | -----    | -----                    | -----                                                                  |
| <b>**type**</b>                      | 1        | <code>&amp;empty;</code> | The language of the code to highlight. Choose from                     |
| <b>**title**</b>                     |          | <code>&amp;empty;</code> | <b>**Extension**</b> . Arbitrary title for code. This disp             |
| <b>**wrap**</b>                      |          | see notes                | <b>**Extension**</b> . When <code>`true`</code> the content may wrap o |
| <b>**options**</b>                   | 2        | <code>&amp;empty;</code> | An optional, comma-separated list of zero or more                      |
| <code>&amp;lt;option&amp;gt;</code>  |          | <code>&amp;empty;</code> | Any of [Hugo's supported options](https://gohugo..                     |
| <code>&amp;lt;content&amp;gt;</code> |          | <code>&amp;empty;</code> | Your code to highlight.                                                |

### Configuration

Default values for [Hugo's supported options](https://gohugo.io/functions/highlight/#options) can be set v

Default values for extension options can be set via params settings in your ``hugo.toml`` or be overwritten

### Global Configuration File

You can configure the color style used for code blocks in your [color variants stylesheet](basics/branding)

```
#### Recommended Settings
{{< multiconfig file=hugo >}}
```

```
[markup]
```

```

[markup.highlight]
    lineNumbersInTable = false
    noClasses = false
{{< /multiconfig >}}

```

#### Optional Settings

```

{{< multiconfig file=hugo >}}
[params]
    highlightWrap = true
{{< /multiconfig >}}

```

### Page's Frontmatter

```

{{< multiconfig fm=true >}}
highlightWrap = true
{{< /multiconfig >}}
## Examples

```

### Line Numbers with Starting Offset

As mentioned above, line numbers in a `table` layout will shift if code is wrapping, so better use `inline`

```

```go
{{< /* highlight lineNos="true" lineNoStart="666" type="py" */>}}
# the hardest part is to start writing code; here's a kickstart; just copy and paste this; it's free; the
print("Hello")
print(" ")
print("World")
print("!")
{{< /* /highlight */>}}
```

```

```

{{< highlight lineNos="true" lineNoStart="666" type="py" >}}
# the hardest part is to start writing code; here's a kickstart; just copy and paste this; it's free; the

```

```
print("Hello")
print(" ")
print("World")
print("!")
{{< /highlight >}}
```

### Codefence with Title

```
````md
```py { title="python" }
# a bit shorter
print("Hello World!")
```
````
```

```
```py { title="python" }
# a bit shorter
print("Hello World!")
```
```

### With Wrap

```
````go
{{< /* highlight type="py" wrap="true" hl_lines="2" */>}}
# Quicksort Python One-liner
lambda L: [] if L==[] else qsort([x for x in L[1:] if x< L[0]]) + L[0:1] + qsort([x for x in L[1:] if x>=L[0]])
# Some more stuff
{{< /* /highlight */>}}
````
```

```
{{< highlight type="py" wrap="true" hl_lines="2" >}}
# Quicksort Python One-liner
```

```
lambda L: [] if L==[] else qsort([x for x in L[1:] if x< L[0]]) + L[0:1] + qsort([x for x in L[1:] if x>=L[0]])
# Some more stuff

{{< /highlight >}}
```

### Without Wrap

```
````go
{{</* highlight type="py" wrap="false" hl_lines="2" */>}}

# Quicksort Python One-liner

lambda L: [] if L==[] else qsort([x for x in L[1:] if x< L[0]]) + L[0:1] + qsort([x for x in L[1:] if x>=L[0]])
# Some more stuff

{{</* /highlight */>}}

````
```

```
{{< highlight type="py" wrap="false" hl_lines="2">}}

# Quicksort Python One-liner

lambda L: [] if L==[] else qsort([x for x in L[1:] if x< L[0]]) + L[0:1] + qsort([x for x in L[1:] if x>=L[0]])
# Some more stuff

{{< /highlight >}}
```

....
```

```
{{% /tab %}}
{{< /tabs >}}
```

### Parameter

| Name            | Position | Default                  | Notes                                                      |
|-----------------|----------|--------------------------|------------------------------------------------------------|
| -----           | -----    | -----                    | -----                                                      |
| <b>**icon**</b> | 1        | <code>&amp;empty;</code> | [Font Awesome icon name](#finding-an-icon) to be displayed |

### Finding an icon

Browse through the available icons in the [Font Awesome Gallery](https://fontawesome.com/v6/search?m=free)

Once on the Font Awesome page for a specific icon, for example the page for the [heart](https://fontawesome.com/v6/icons/heart)

### ### Customising Icons

Font Awesome provides many ways to modify the icon

- Change color (by default the icon will inherit the parent color)
- Increase or decrease size
- Rotate
- Combine with other icons

Check the full documentation on [web fonts with CSS](https://fontawesome.com/how-to-use/web-fonts-with-css)

## ## Examples

### ### Standard Usage

```
````go
```

Built with `{{%/ * icon heart */%}}` by Relearn and Hugo

```
````
```

Built with `{{% icon heart %}}` by Relearn and Hugo

### ### Advanced HTML Usage

While the shortcode simplifies using standard icons, the icon customization and other advanced features of

```
````html
```

Built with `<i class="fas fa-heart"></i>` by Relearn and Hugo

```
````
```

Built with `<i class="fas fa-heart"></i>` by Relearn and Hugo

To use these native HTML elements in your Markdown, add this in your ``hugo.toml``:

```
````toml
```

```
[markup.goldmark.renderer]
```

```
unsafe = true
```

```
.....
```

  "align"     "center"

)}}

````

```

```

{{% /tab %}}

{{% tab title="passthrough" %}}

```

```

````md

$$\left(\sum_{k=1}^n a_k b_k\right)^2 \leq \left(\sum_{k=1}^n a_k^2\right) \left(\sum_{k=1}^n b_k^2\right)$$

````

```

```

{{% /tab %}}

{{< /tabs >}}

```

```

### Parameter
| Name | Default | Notes |
|-----|-----|-----|
| **align** | `center` | Allowed values are `left`, `center` or `right`. |
| _**&lt;content&gt;**_ | _&lt;empty&gt;_ | Your formulae. |

```

```

## Configuration
MathJax is configured with default settings but you can customize MathJax's default settings for all of your pages.
The JSON object of your `hugo.toml` / frontmatter is forwarded into MathJax's configuration object.

```

See [MathJax documentation](https://docs.mathjax.org/en/latest/options/index.html) for all allowed settings.

### ### Global Configuration File

This example reflects the default configuration also used if you don't define `mathJaxInitialize`

```
{{< multiconfig file=hugo >}}
[params]
  mathJaxInitialize = "{ \"tex\": { \"inlineMath\": [[\"\\(\", \"\\)\", [\"$\", \"$\"]], displayMath: [\"\\[\", \"\\]\"] } } }"
{{< /multiconfig >}}
```

### ### Page's Frontmatter

Usually you don't need to redefine the global initialization settings for a single page. But if you do, you can use the `mathJaxInitialize` variable in the page's frontmatter.

Eg. If you have redefined the delimiters to something exotic like `@` symbols in your global config, but want to use the default delimiters on a single page, you can do:

```
{{< multiconfig fm=true >}}
mathJaxInitialize = "{ \"html\": { \"displayAlign\": \"left\" }, { \"tex\": { \"inlineMath\": [[\"\\(\", \"\\)\", [\"$\", \"$\"]], displayMath: [\"\\[\", \"\\]\"] } } }"
{{< /multiconfig >}}
```

### ### Passthrough Configuration

You can use your math without enclosing it in a shortcode or codefence by using a [passthrough configuration].

```
{{< multiconfig file=hugo >}}
[markup]
  [markup.goldmark]
    [markup.goldmark.extensions]
      [markup.goldmark.extensions.passthrough]
        enable = true
      [markup.goldmark.extensions.passthrough.delimiters]
        inline = [['\\(', '\\)'], ['$ ', '$']]
        block  = [['\\[', '\\]'], ['$$ ', '$$']]
{{< /multiconfig >}}
```

In this case you have to tell the theme that your page contains math by setting this in your page's frontmatter:

```
{{< multiconfig fm=true >}}
disableMathJax = false
{{< /multiconfig >}}
```

See the [example](#passthrough) on how it makes using math really easy.

## ## Examples

### ### Inline Math

```
````md
Inline math is generated if you use a single ``$` as a delimiter around your formulae: {{</* math */>}}$sqrt{2}
````
```

Inline math is generated if you use a single ``\$` as a delimiter around your formulae: {{< math >}}\$sqrt{2}

### ### Blocklevel Math with Right Alignment

```
````md
If you delimit your formulae by two consecutive ``$$` it generates a new block.

{{</* math align="right" */>}}
$$\left( \sum_{k=1}^n a_k b_k \right)^2 \leq \left( \sum_{k=1}^n a_k^2 \right) \left( \sum_{k=1}^n b_k^2 \right)
{{</* /math */>}}
````
```

If you delimit your formulae by two consecutive ``\$\$` it generates a new block.

```
{{< math align="right" >}}
$$\left( \sum_{k=1}^n a_k b_k \right)^2 \leq \left( \sum_{k=1}^n a_k^2 \right) \left( \sum_{k=1}^n b_k^2 \right)
{{< /math >}}
```

### ### Codefence

You can also use codefences.

```
````md
```math
$$\left( \sum_{k=1}^n a_k b_k \right)^2 \leq \left( \sum_{k=1}^n a_k^2 \right) \left( \sum_{k=1}^n b_k^2 \right)
```
````
```

```
````math
$$\left( \sum_{k=1}^n a_k b_k \right)^2 \leq \left( \sum_{k=1}^n a_k^2 \right) \left( \sum_{k=1}^n b_k^2 \right)
````
```

### Passthrough

This works for block as well as inline math but is only available if you are using the [passthrough configuration](https://github.com/remarkjs/remark-math#passthrough).

With passthrough configuration you can just drop your math without enclosed by shortcodes or codefences but you must use the `math` shortcode.

```
````md
$$\left|
\begin{array}{cc}
a & b \\
c & d
\end{array}
\right|
$$
````
```

```
$$\left|
\begin{array}{cc}
a & b \\
c & d
\end{array}
\right|
$$
```

### Chemical Formulae

```
````md
```

```
{{</* math */>}}
```

$$\text{Hg}^{2+} \rightarrow [\text{I}^-] \text{HgI}_2 \rightarrow [\text{I}^-] [\text{Hg}^{\text{II}}\text{I}_4]^{2-}$$

.....

$$\{\{< \text{math} >\}$$

$$\text{Hg}^{2+} \rightarrow [\text{I}^-] \text{HgI}_2 \rightarrow [\text{I}^-] [\text{Hg}^{\text{II}}\text{I}_4]^{2-}$$

$$\{\{< /math >\}$$

*Resumo: +++ description = "Generate diagrams and flowcharts from text" title = "Mermaid" +++  
The `mermaid` shortcode generates diagrams and flowcharts from text, in a similar manner as Markdown using the [Mermaid](https://mermaidjs.github.io/) library. {{< mermaid align="center">}} graph LR; ...*

+++

description = "Generate diagrams and flowcharts from text"

title = "Mermaid"

+++

The `mermaid` shortcode generates diagrams and flowcharts from text, in a similar manner as Markdown using

{{< mermaid align="center">}}

graph LR;

    If --> Then

    Then --> Else

{{< /mermaid >}}

## Usage

While the examples are using shortcodes with named parameter it is recommended to use codefences instead.

You are free to also call this shortcode from your own partials.

{{< tabs groupid="shortcode-parameter">}}

{{% tab title="codefence" %}}

````md

``mermaid { align="center" zoom="true" }

graph LR;

    If --> Then

    Then --> Else

````

````

{{% /tab %}}

```
{{% tab title="shortcode" %}}

````go

{{</* mermaid align="center" zoom="true" */>}}

graph LR;

    If --> Then

    Then --> Else

{{</* /mermaid */>}}

````
```

```
{{% /tab %}}

{{% tab title="partial" %}}
```

```
````go

{{ partial "shortcodes/mermaid.html" (dict

    "page"      .

    "content" "graph LR;\nIf --> Then\nThen --> Else"

    "align"      "center"

    "zoom"      "true"

)}}

````
```

```
{{% /tab %}}

{{< /tabs >}}
```

The generated graphs can be panned by dragging them and zoomed by using the mousewheel. On mobile devices

| ### Parameter                                                                                             |                                |                                                               |  |  |  |
|-----------------------------------------------------------------------------------------------------------|--------------------------------|---------------------------------------------------------------|--|--|--|

| <b>**zoom**</b>                                                                                           | see notes                      | Whether the graph is pan- and zoomable.<br><br>If not set the |  |  |  |
| <b>_**&amp;lt;content&amp;gt;**_</b>                                                                      | <b>_&amp;lt;empty&amp;gt;_</b> | Your Mermaid graph.                                           |  |  |  |
| ## Configuration                                                                                          |                                |                                                               |  |  |  |
| Mermaid is configured with default settings. You can customize Mermaid's default settings for all of your |                                |                                                               |  |  |  |

The JSON object of your `hugo.toml` / frontmatter is forwarded into Mermaid's `mermaid.initialize()` function.

See [Mermaid documentation](https://mermaid-js.github.io/mermaid/#/Setup?id=mermaidapi-configuration-defaults).

The `theme` setting can also be set by your used color variant. This will be the sitewide default and can be overridden per page.

### ### Global Configuration File

```
{{< multiconfig file=hugo >}}

[params]

mermaidInitialize = "{ \"theme\": \"dark\" }"

mermaidZoom = true

{{< /multiconfig >}}
```

### ### Page's Frontmatter

```
{{< multiconfig fm=true >}}

mermaidInitialize = "{ \"theme\": \"dark\" }"

mermaidZoom = true

{{< /multiconfig >}}
```

## ## Examples

### ### Flowchart with YAML-Title

```
````go
{{< /* mermaid */ >}}

---

title: Example Diagram

---

## Examples  
### By Severity

#### Info with markup

```
....`go
```

```
{{%/ * notice style="info" */%}}
```

An **information** disclaimer

You can add standard markdown syntax:

- multiple paragraphs
- bullet point lists
- emphasized, **bold** and even **bold emphasized** text
- [links](https://example.com)
- etc.

```
```plaintext
```

...and even source code

```
```
```

> the possibilities are endless (almost - including other shortcodes may or may not work)

```
{{%/ * /notice */%}}
```

```
````
```

```
{{% notice style="info" %}}
```

An **information** disclaimer

You can add standard markdown syntax:

- multiple paragraphs
- bullet point lists
- emphasized, **bold** and even **bold emphasized** text
- [links](https://example.com)
- etc.

```
```plaintext
```

...and even source code

```
```
```

> the possibilities are endless (almost - including other shortcodes may or may not work)

```
{{% /notice %}}
```

#### Note

````go

```
{{%/ * notice style="note" */%}}
```

A **\*\*notice\*\*** disclaimer

```
{{%/ * /notice */%}}
```

````

```
{{% notice style="note" %}}
```

A **\*\*notice\*\*** disclaimer

```
{{% /notice %}}
```

#### Tip

````go

```
{{%/ * notice style="tip" */%}}
```

A **\*\*tip\*\*** disclaimer

```
{{%/ * /notice */%}}
```

````

```
{{% notice style="tip" %}}
```

A **\*\*tip\*\*** disclaimer

```
{{% /notice %}}
```

#### Warning

````go

```
{{%/ * notice style="warning" */%}}
```

A **\*\*warning\*\*** disclaimer

```
{{%/ * /notice */%}}
```

````

```
{{% notice style="warning" %}}
```

A **\*\*warning\*\*** disclaimer

```
{{% /notice %}}
```

### #### Warning with Non-Default Title and Icon

```
````go
{{%/ * notice style="warning" title="Here are dragons" icon="dragon" */%}}
A **warning** disclaimer
{{%/ * /notice */%}}
````
```

```
{{% notice style="warning" title="Here are dragons" icon="dragon" %}}
A **warning** disclaimer
{{% /notice %}}
```

### #### Warning without a Title and Icon

```
````go
{{%/ * notice style="warning" title=" " icon=" " */%}}
A **warning** disclaimer
{{%/ * /notice */%}}
````
```

```
{{% notice style="warning" title=" " icon=" " %}}
A **warning** disclaimer
{{% /notice %}}
```

### ### By Brand Colors

#### #### Primary with Title only

```
````go
{{%/ * notice style="primary" title="Primary" */%}}
A **primary** disclaimer
{{%/ * /notice */%}}
````
{{% notice style="primary" title="Primary" %}}
A **primary** disclaimer
```

```
{{% /notice %}}
```

#### Secondary with Icon only

```
````go
{{%/ * notice style="secondary" icon="stopwatch" */%}}
A **secondary** disclaimer
{{%/ * /notice */%}}
````
```

```
{{% notice style="secondary" icon="stopwatch" %}}
A **secondary** disclaimer
{{% /notice %}}
```

#### Accent

```
````go
{{%/ * notice style="accent" */%}}
An **accent** disclaimer
{{%/ * /notice */%}}
````
```

```
{{% notice style="accent" %}}
An **accent** disclaimer
{{% /notice %}}
```

### By Color

#### Blue without a Title and Icon

```
````go
{{%/ * notice style="blue" */%}}
A **blue** disclaimer
{{%/ * /notice */%}}
````
```

```
{{% notice style="blue" %}}
```

```
A **blue** disclaimer
```

```
{{% /notice %}}
```

```
#### Green with Title only
```

```
````go
```

```
{{%/ notice style="green" title="Green" */%}}
```

```
A **green** disclaimer
```

```
{{%/ /notice */%}}
```

```
````
```

```
{{% notice style="green" title="Green" %}}
```

```
A **green** disclaimer
```

```
{{% /notice %}}
```

```
#### Grey with Icon only
```

```
````go
```

```
{{%/ notice style="grey" icon="bug" */%}}
```

```
A **grey** disclaimer
```

```
{{%/ /notice */%}}
```

```
````
```

```
{{% notice style="grey" icon="bug" %}}
```

```
A **grey** disclaimer
```

```
{{% /notice %}}
```

```
#### Orange with Title and Icon
```

```
````go
```

```
{{%/ notice style="orange" title="Orange" icon="bug" */%}}
```

```
A **orange** disclaimer
```

```
{{%/ /notice */%}}
```

```
````
```

```
{{% notice style="orange" title="Orange" icon="bug" %}}
```

```
A **orange** disclaimer
```

```
{{% /notice %}}
```

```
#### Red without a Title and Icon
```

```
````go
```

```
{{%/ * notice style="red" */%}}
```

```
A red disclaimer
```

```
{{%/ * /notice */%}}
```

```
````
```

```
{{% notice style="red" %}}
```

```
A red disclaimer
```

```
{{% /notice %}}
```

```
### By Special Color
```

```
#### Default with Positional Parameter
```

```
````go
```

```
{{%/ * notice default "Pay Attention to this Note!" "skull-crossbones" */%}}
```

```
Some serious information.
```

```
{{%/ * /notice */%}}
```

```
````
```

```
{{% notice default "Pay Attention to this Note!" "skull-crossbones" %}}
```

```
Some serious information.
```

```
{{% /notice %}}
```

```
#### Transparent with Title and Icon
```

```
````go
```

```
{{%/ * notice style="transparent" title="Pay Attention to this Note!" icon="skull-crossbones" */%}}
```

```
Some serious information.
```

```
{{%/ * /notice */%}}
```

```
````
```

```
{{% notice style="transparent" title="Pay Attention to this Note!" icon="skull-crossbones" %}}  
Some serious information.  
{{% /notice %}}
```

### With User-Defined Color, Font Awesome Brand Icon and Markdown Title

```
````go  
{{%/ * notice color="fuchsia" title="**Hugo**" icon="fa-fw fab fa-hackerrank" */%}}  
Victor? Is it you?  
{{%/ * /notice */%}}  
````
```

```
{{% notice color="fuchsia" title="**Hugo**" icon="fa-fw fab fa-hackerrank" %}}  
Victor? Is it you?  
{{% /notice %}}
```

openapi: 3.0.2

info:

title: Swagger Petstore - OpenAPI 3.0

description: |-

This is a sample Pet Store Server based on the OpenAPI 3.0 specification. You can find out more about Swagger at [http://swagger.io](http://swagger.io). In the third iteration of the pet store, we've switched to the new OpenAPI 3.0 specification, in order to improve the API. You can now help us improve the API whether it's by making changes to the definition itself or to the Swagger UI examples. That way, with time, we can improve the API in general, and expose some of the new features in OAS3.

Some useful links:

- [The Pet Store repository](https://github.com/swagger-api/swagger-petstore)
- [The source API definition for the Pet Store](https://github.com/swagger-api/swagger-petstore/blob/master/src/main/resources/openapi.yaml)

description = "List resources contained in a page bundle"

title = "Resources"

[[resources]]

name = 'MaybeTreasure.txt'

src = 'MaybeTreasure.en.txt'

+++

The `resources` shortcode displays the [titles](https://gohugo.io/methods/resource/title/) of resources contained in a [page bundle]

{{% resources sort="asc" %}}

## Usage

While the examples are using shortcodes with named parameter you are free to also call this shortcode from a template

{{< tabs groupid="shortcode-parameter">}}

{{% tab title="shortcode" %}}

~~~~go

{{%/resources sort="asc" %/}}

~~~~

{{% /tab %}}

{{% tab title="partial" %}}

~~~~go

{{ partial "shortcodes/resources.html" (dict

"page" .

"sort" "asc"

```
)}}
....
```

```
{{% /tab %}}
{{< /tabs >}}
```

Multilanguage features are not supported directly by the shortcode but rely on Hugo's handling for resource

Parameter

| Name | Default | Notes |
|----------------|----------------------------|--|
| ----- | ----- | ----- |
| style | <code>`transparent`</code> | The style scheme used for the box.

- by severity: <code>`info`</code> , <code>`note`</code> , <code>`warning`</code> , <code>`error`</code> |
| color | see notes | The [CSS color value](https://developer.mozilla.org/en-US/docs/Web/CSS/color-value) |
| title | see notes | Arbitrary text for the box title. Depending on the style there may be a default |
| icon | see notes | [Font Awesome icon name](https://fontawesome.com/icons) set to the left of the title |
| sort | <code>`asc`</code> | Sorting the output in <code>`asc`</code> ending or <code>`desc`</code> ending order. |
| pattern | <code>`.*`</code> | A [regular expressions](https://en.wikipedia.org/wiki/Regular_expression) |

Examples

Custom Title, List of Resources Ending in png, jpg or gif

```
....go
{{%/ resources title="Related **files**" pattern=".*\.(png|jpg|gif)" /%/}}
....
```

```
{{% resources title="Related **files**" pattern=".*\.(png|jpg|gif)" /%}}
```

Info Styled Box, Descending Sort Order

```
....go
{{%/ resources style="info" sort="desc" /%/}}
....
```

```
{{% resources style="info" sort="desc" /%}}
```

With User-Defined Color and Font Awesome Brand Icon

```
```\go
```

```
{{%/resources color="fuchsia" icon="fa-fw fab fa-hackerrank" /%}}
```

```
```\
```

```
{{%resources color="fuchsia" icon="fa-fw fab fa-hackerrank" /%}}
```

Style, Color, Title and Icons

For further examples for **style**, **color**, **title** and **icon**, see the [`notice` shortcode`](short

Resumo: +++ description = "Get value of site params" title = "SiteParam" +++ The `siteparam` shortcode prints values of site params. ## Usage While the examples are using shortcodes with named parameter you are free to use positional as well or call this shortcode from your own partials. {{< ...

```
+++
```

```
description = "Get value of site params"
```

```
title = "SiteParam"
```

```
+++
```

The `siteparam` shortcode prints values of site params.

Usage

While the examples are using shortcodes with named parameter you are free to use positional as well or call

```
{{< tabs groupid="shortcode-parameter">}}
```

```
{{% tab title="shortcode" %}}
```

```
````go
```

```
{{%/ * siteparam name="editURL" */%}}
```

```
````
```

```
{{% /tab %}}
```

```
{{% tab title="shortcode (positional)" %}}
```

```
````go
```

```
{{%/ * siteparam "editURL" */%}}
```

```
````
```

```
{{% /tab %}}
```

```
{{% tab title="partial" %}}
```

```
````go
```

```
{{ partial "shortcodes/siteparam.html" (dict
```

```

 "page" .
 "name" "editURL"
)}}

```

```

{{% /tab %}}
{{< /tabs >}}

```

### Parameter

| Name     | Position | Default         | Notes                                       |
|----------|----------|-----------------|---------------------------------------------|
| -----    | -----    | -----           | -----                                       |
| **name** | 1        | _&lt;empty&gt;_ | The name of the site param to be displayed. |

### Examples

### `editURL` from `hugo.toml`

```

```go
`editURL` value: {{%/ * siteparam name="editURL" */%}}
...

```

```

`editURL` value: {{% siteparam name="editURL" %}}

```

Nested parameter with Markdown and HTML formatting

To use formatted parameter, add this in your `hugo.toml`:

```

{{< multiconfig file=hugo >}}

[markup.goldmark.renderer]
unsafe = true

{{< /multiconfig >}}

```

Now values containing Markdown will be formatted correctly.

```

{{< multiconfig file=hugo >}}
[params]

```

```
[params.siteparam.test]

    text = "A **nested** parameter <b>with</b> formatting"
{{< /multiconfig >}}

```go
Formatted parameter: {{%/* siteparam name="siteparam.test.text" */%}}
...

Formatted parameter: {% siteparam name="siteparam.test.text" %}}
```

description = "Show content in a single tab"

title = "Tab"

+++

You can use a `tab` shortcode to display a single tab.

This is especially useful if you want to flag your code example with an explicit language.

If you want multiple tabs grouped together you can wrap your tabs into the [ `tabs` shortcode ](shortcodes/

```
{{% tab title="c" %}}
```

```
```python
```

```
printf("Hello World!");
```

```
```
```

```
{{% /tab %}}
```

## Usage

While the examples are using shortcodes with named parameter you are free to also call this shortcode from

```
{{< tabs groupid="shortcode-parameter">}}
```

```
{{% tab title="shortcode" %}}
```

```
```go
```

```
{{%/* tab title="c" */%}}
```

```
```c
```

```
printf("Hello World!");
```

```

...

{{%/ * /tab */%}}

....

{{% /tab %}}

{{% tab title="partial" %}}

```go
{{ partial "shortcodes/tab.html" (dict
    "page" .
    "title" "c"
    "content" ("```c\nprintf(\"Hello World!\")\n```" | .RenderString)
)}}
....

{{% /tab %}}

{{< /tabs >}}

```

Parameter

| Name | Default | Notes |
|-----------------|---------------|--|
| ----- | ----- | ----- |
| style | see notes | The style scheme used for the tab. If you don't set a style a |
| color | see notes | The [CSS color value](https://developer.mozilla.org/en-US/doc |
| title | see notes | Arbitrary title for the tab. Depending on the style there |
| icon | see notes | [Font Awesome icon name](shortcodes/icon#finding-an-icon) set |
| _content | _empty | Arbitrary text to be displayed in the tab. |

Examples

Single Code Block with Collapsed Margins

```

```go
{{%/ * tab title="Code" */%}}

```python
printf("Hello World!");

```

```
```
```

```
{{%/ * /tab */%}}
```

```
````
```

```
{{% tab title="Code" %}}
```

```
```python
```

```
printf("Hello World!");
```

```
```
```

```
{{% /tab %}}
```

```
### Mixed Markdown Content
```

```
```go
```

```
{{%/ * tab title="_**Mixed**_" */%}}
```

A tab can not only contain code but arbitrary text. In this case text **and** code will get a margin.

```
```python
```

```
printf("Hello World!");
```

```
```
```

```
{{%/ * /tab */%}}
```

```
````
```

```
{{% tab title="_**Mixed**_" %}}
```

A tab can not only contain code but arbitrary text. In this case text **and** code will get a margin.

```
```python
```

```
printf("Hello World!");
```

```
```

```
### Understanding `style` and `color` Behavior
```

The `style` parameter affects how the `color` parameter is applied.

````go

```
{{</ * tabs */>}}
```

```
{{%/ * tab title="just colored style" style="blue" */%}}
```

The `style` parameter is set to a color style.

This will set the background to a lighter version of the chosen style color as configured in your theme variant.

```
{{%/ * /tab */%}}
```

```
{{%/ * tab title="just color" color="blue" */%}}
```

Only the `color` parameter is set.

This will set the background to a lighter version of the chosen CSS color value.

```
{{%/ * /tab */%}}
```

```
{{%/ * tab title="default style and color" style="default" color="blue" */%}}
```

The `style` parameter affects how the `color` parameter is applied.

The `default` style will set the background to your `--MAIN-BG-color` as configured for your theme variant.

```
{{%/ * /tab */%}}
```

```
{{%/ * tab title="just severity style" style="info" */%}}
```

The `style` parameter is set to a severity style.

This will set the background to a lighter version of the chosen style color as configured in your theme variant.

```
{{%/ * /tab */%}}
```

```
{{%/ * tab title="severity style and color" style="info" color="blue" */%}}
```

The `style` parameter affects how the `color` parameter is applied.

This will set the background to a lighter version of the chosen CSS color value and also affects the chosen severity style.

```
{{%/ * /tab */%}}
```

```
{{</ * /tabs */>}}
```

````

```
{{< tabs >}}
```

```
{{% tab title="just colored style" style="blue" %}}
```

The `style` parameter is set to a color style.

This will set the background to a lighter version of the chosen style color as configured in your theme variant.

```
{{% /tab %}}
```

```
{{% tab title="just color" color="blue" %}}
```

Only the `color` parameter is set.

This will set the background to a lighter version of the chosen CSS color value.

```
{{% /tab %}}
```

```
{{% tab title="default style and color" style="default" color="blue" %}}
```

The `style` parameter affects how the `color` parameter is applied.

The `default` style will set the background to your `--MAIN-BG-color` as configured for your theme variant.

```
{{% /tab %}}
```

```
{{% tab title="just severity style" style="info" %}}
```

The `style` parameter is set to a severity style.

This will set the background to a lighter version of the chosen style color as configured in your theme variant.

```
{{% /tab %}}
```

```
{{% tab title="severity style and color" style="info" color="blue" %}}
```

The `style` parameter affects how the `color` parameter is applied.

This will set the background to a lighter version of the chosen CSS color value and also affects the chosen severity style.

```
{{% /tab %}}
```

```

description = "Show content in tabbed views"

title = "Tabs"

+++

The `tabs` shortcode displays arbitrary content in an unlimited number of tabs.

This comes in handy eg. for providing code snippets for multiple languages.

If you just want a single tab you can instead call the [tab` shortcode](shortcodes/tab) standalone.

```
{{< tabs title="hello." >}}
```

```
{{% tab title="py" %}}
```

```
```python
```

```
print("Hello World!")
```

```
```
```

```
{{% /tab %}}
```

```
{{% tab title="sh" %}}
```

```
```bash
```

```
echo "Hello World!"
```

```
```
```

```
{{% /tab %}}
```

```
{{% tab title="c" %}}
```

```
```c
```

```
printf("Hello World!");
```

```
...
```

```
{{% /tab %}}
```

```
{{< /tabs >}}
```

### ## Usage

While the examples are using shortcodes with named parameter you are free to also call this shortcode from

See the [``tab`` shortcode](shortcodes/tab) for a description of the parameter for nested tabs.

```
{{< tabs groupid="shortcode-parameter">}}
```

```
{{% tab title="shortcode" %}}
```

```
````go
```

```
{{</ * tabs title="hello." */>}}
```

```
{{%/* tab title="py" */%}}
```

```
```python
```

```
print("Hello World!")
```

```
...
```

```
{{%/* /tab */%}}
```

```
{{%/* tab title="sh" */%}}
```

```
```bash
```

```
echo "Hello World!"
```

```
...
```

```
{{%/* /tab */%}}
```

```
{{%/* tab title="c" */%}}
```

```
```c
```

```
printf("Hello World!");
```

```
...
```

```
{{%/* /tab */%}}
```

```
{{</ * /tabs */>}}
```

```
````
```

```
{{% /tab %}}
```

```
{{% tab title="partial" %}}

```go
{{ partial "shortcodes/tabs.html" (dict
 "page" .
 "title" "hello."
 "content" (slice
 (dict
 "title" "py"
 "content" ("```python\nprint(\"Hello World!\")\n```" | .RenderString)
)
 (dict
 "title" "sh"
 "content" ("```bash\nnecho \"Hello World!\"\n```" | .RenderString)
)
 (dict
 "title" "c"
 "content" ("```c\nprintf(\"Hello World!\");\n```" | .RenderString)
)
)
)}}
```
```

```
{{% /tab %}}
{{< /tabs >}}
```

Parameter

| Name | Default | Notes |
|----------------|-----------|---|
| ----- | ----- | ----- |
| groupid | <random>_ | Arbitrary name of the group the tab view belongs to.
 |
| style | <empty>_ | Sets a default value for every contained tab. Can be over |
| color | <empty>_ | Sets a default value for every contained tab. Can be over |
| title | <empty>_ | Arbitrary title written in front of the tab view. |
| icon | <empty>_ | [Font Awesome icon name](shortcodes/icon#finding-an-icon |

| `_**<content>*_` | `_<empty>_` | Arbitrary number of tabs defined with the ``tab`` sub-shortcut

Examples

Behavior of the ``groupid``

See what happens to the tab views while you select different tabs.

While pressing a tab of Group A switches all tab views of Group A in sync (if the tab is available), the

/*

JavaScript autoComplete v1.0.4+

McShelby/hugo-theme-relearn#155

- PR #46, PR #75: introducing selectorToInsert and anchor to it
- sticky dropdown on scrolling

McShelby/hugo-theme-relearn#387

- don't empty search input if no data-val is given
- don't delete search term but close suggestions when suggestions are open
- delete search term when suggestions are closed

McShelby/hugo-theme-relearn#452

- register focus event ignoring minChars because that doesn't make sense

McShelby/hugo-theme-relearn#452

- on ESC, close overlay without deleting search term if overlay is open
- on ESC, delete search term if overlay is closed
- on UP, preventDefault to keep cursor in position
